## **PART 5**

### **PIX/ASA/FWSM Device Configuration**

## CHAPTER 45

# Managing Firewall Devices

---

The following topics describe configuration and management of security services and policies on Cisco security devices: Adaptive Security Appliances (ASAs), PIX Firewalls, and the Catalyst 6500 series switch Services Modules—that is, Firewall Services Modules (FWSMs) and ASA-SMs.

This chapter contains the following topics:

- [Firewall Device Types, page 45-1](#)
- [Default Firewall Configurations, page 45-2](#)
- [Configuring Firewall Device Interfaces, page 45-2](#)

## Firewall Device Types

Security Manager can discover and manage a variety of Cisco security appliances or firewall devices, most notably the following:

- PIX 500 Series firewall devices
- ASA 5500 Series security appliances
- Security-specific Catalyst Services Modules

### PIX 500 Series

The Private Internet eXchange (PIX) 500 Series firewall appliances are no longer sold, however they are still supported and a great many are still in use world-wide.

### ASA 5500 Series

The Adaptive Security Appliance (ASA) 5500 Series devices provide comprehensive security services, including context-aware firewall capabilities and real-time threat defense. The ASA 5500 has replaced the PIX 500 as Cisco's primary security appliance. Visit the [Cisco ASA 5500 Series Adaptive Security Appliance page](#) on cisco.com for more information.

### Catalyst Services Modules

A variety of Services Modules (SMs) are available for the Catalyst 6500 switch, including two that provide firewall and security services. These are blade-type modules that are installed directly into the switch chassis.

The Firewall Services module (FWSM) allows any port on the switch to operate as a firewall port, integrating firewall security inside the network structure. See [Cisco Catalyst 6500 Series Firewall Services Module](#) for more information.

The Adaptive Security Appliance service module (ASA-SM) provides high-speed security services across Layers 2 through 7, and you can install up to four ASA-SM blades in a single switch, providing scalability to 64 Gbps. See [Cisco Catalyst 6500 Series ASA Services Module](#) for more information.

**Note**

While the ASA-SM is a blade installed in a Catalyst 6500 switch—much like the FWSM physically—it is an ASA device, and it is documented as such. That is, refer to ASA-related topics for information about the ASA-SM. Where necessary, caveats and differences between the Service Module and the ASA appliance are noted.

## Default Firewall Configurations

Firewall devices are shipped with certain settings already configured. When you manually add a newly installed firewall device to Cisco Security Manager, you should discover (import) the pre-set or default policies for that device. Importing these policies into Security Manager prevents them being unintentionally removed the first time you deploy a configuration to that device. For more information about importing policies, see [Discovering Policies, page 5-12](#).

Cisco Security Manager provides a set of configuration files that contain default policies for a number of device types and versions. These configuration files are located in the directory:

```
<install_dir>\CSCOp\MDC\fwtools\pixplatform\ (for example, C:\Program
Files\CSCOp\MDC\fwtools\pixplatform\).
```

The file name indicates device type, operating system version, context support, and operation type. For example, “FactoryDefault\_FWSM2\_2\_MR.cfg” is the configuration file for an FWSM, version 2.2, with support for Multiple contexts, operating in Routed mode. Similarly, “FactoryDefault\_ASA7\_0\_1\_ST.cfg” is the configuration file for an ASA, version 7.0.1, in Single-context, Transparent mode.

Refer to [Interfaces in Single and Multiple Contexts, page 45-5](#) for more about security contexts, and [Interfaces in Routed and Transparent Modes, page 45-4](#) for more about routed and transparent operation.

See [Adding Devices from Configuration Files, page 3-20](#) for information about adding new devices from the supplied configuration files.

## Configuring Firewall Device Interfaces

The Interfaces page displays configured physical interfaces, logical interfaces, and redundant interfaces, as well as hardware ports and bridge groups, for the selected device. From this page, you can add, edit and delete interfaces; enable communication between interfaces on the same security level; and manage VPDN groups and PPPoE users.

**Note**

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: Hardware Ports and Interfaces. Similarly, the Interfaces page displayed for the Catalyst 6500 services modules (ASA-SMs and FWSMs) operating in transparent mode also presents two tabbed panels: Interfaces and Bridge Groups.

### Navigation Path

To access the Interfaces page, select a security device in Device View and then select **Interfaces** from the Device Policy selector.

This section contains the following topics:

- [Understanding Device Interfaces, page 45-3](#)
- [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#)
- [Advanced Interface Settings \(PIX/ASA/FWSM\), page 45-42](#)

## Understanding Device Interfaces

An interface is a point of connection between a security device and some other network device. Interfaces are initially disabled; thus, as an essential part of firewall configuration, interfaces must be enabled and configured to allow appropriate packet inspection and forwarding.

There are two types of interface: physical and logical, where a physical interface is the actual slot on the device into which a network cable is plugged, and a logical interface is a virtual port assigned to a specific physical port. Generally, physical ports are referred to as interfaces, while logical ports are referred to as subinterfaces, virtual interfaces, VLANs, or EtherChannels, depending on their function. The number and type of interfaces you can define varies with appliance model and type of license purchased.

### Note

On devices running version 6.3 of the PIX operating system, the labels “physical” and “logical” are used, rather than “interface” and “subinterface.” Also, transparent mode and multiple contexts are not supported on these devices.

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN IDs. Because VLANs keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances. This feature is particularly useful in multiple-context mode, allowing you to assign unique interfaces to each context.

As a general rule, interfaces attach to router-based networks, and subinterfaces attach to switch-based networks. All subinterfaces must be associated with a physical interface that is responsible for routing allowed traffic correctly.

If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. The physical interface must be enabled for the subinterface to pass traffic, but do not name the physical interface to ensure it does not pass traffic. However, if you do want to let the physical interface pass untagged packets, you can name the interface as usual. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#) for information about naming an interface.

### Note

The ASA 5505, combining switch and security appliance features, is a special case in that you configure both physical switch ports and logical VLAN interfaces. See [Understanding ASA 5505 Ports and Interfaces, page 45-6](#) for more information.

The Catalyst 6500 services modules (ASA-SMs and FWSMs) do not include any external physical interfaces—instead, they use internal VLAN interfaces. For example, assume you assign VLAN 201 to an FWSM inside interface, and VLAN 200 to the outside interface. You assign these VLANs to physical switch ports, and hosts connect to those ports. When communication occurs between VLANs 201 and 200, the FWSM is the only available path between the VLANs, forcing traffic to be statefully inspected.

See the following sections for additional information about device interfaces:

- [Interfaces in Routed and Transparent Modes, page 45-4](#)
- [Interfaces in Single and Multiple Contexts, page 45-5](#)
- [Understanding ASA 5505 Ports and Interfaces, page 45-6](#)
- [Configuring Subinterfaces \(PIX/ASA\), page 45-7](#)
- [Configuring Redundant Interfaces, page 45-7](#)
- [Configuring EtherChannels, page 45-8](#)

### Security Appliance Configurations

Firewall devices allow a variety of configurations, and the configuration determines how to define the interfaces associated with a specific device. The following table outlines the various configurations.

**Table 45-1 Security Appliance Configurations**

| Device Type                                                   | Operational Mode (Router or Transparent) | Context Support (Single or Multiple)                                                            |
|---------------------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------------------|
| PIX 6.3.x                                                     | N/A                                      | N/A                                                                                             |
| PIX 7.0+/ASA                                                  | Router or Transparent                    | Single                                                                                          |
| PIX 7.0+/ASA, or security context of unmanaged PIX 7.0+/ASA   | Router or Transparent                    | Multiple (see <a href="#">Checklist for Configuring Multiple Security Contexts, page 57-2</a> ) |
| FWSM, or security context of unmanaged switch (multiple mode) | Router or Transparent                    | Single or Multiple                                                                              |

## Interfaces in Routed and Transparent Modes

Beginning with ASA/PIX 7.0 and FWSM 2.2.1, you can configure a security device to operate in one of two modes: *routed* or *transparent*. (The PIX 6.3 operates only in routed mode.)

In routed mode, the security appliance acts as a gateway or router for connected networks: it maintains IP addresses for its interfaces, and inspects and filters traffic traversing these interfaces based on IP address (Layer 3) information. In this mode, each device interface is connected to a different IP subnet, and has its own IP address on that subnet. Routed mode supports up to 256 interfaces in single mode or per context, with a maximum of 1000 interfaces divided between all contexts.

In transparent mode, the security appliance operates as a Layer 2 (data link) device, or transparent bridge, and is often referred to as a “bump in the wire,” or a “stealth firewall.” In this mode, you can define only two interfaces: inside and outside. The interfaces do not require IP addresses; they use VLAN IDs to forward inspected traffic. However, if the device includes a dedicated management interface, you can use it—either the physical interface or a subinterface—as a third interface for device-management traffic.

#### Note

Cisco Security Manager does not populate the interface information for FWSM 2.x devices during discovery.

### Bridge Groups

Beginning with the ASA 8.4.1 and FWSM 3.1, in transparent mode, you can increase the number of interfaces available to a device or context through use of bridge groups. You can configure up to eight bridge groups; on an FWSM each group can contain two interfaces; on an ASA each group can contain four interfaces. See [Add/Edit Bridge Group Dialog Box, page 45-41](#) for more information.

### Related Topics

- [Chapter 46, “Configuring Bridging Policies on Firewall Devices”](#)

## Interfaces in Single and Multiple Contexts

Security “contexts” allow a single physical device to operate as multiple, independent firewalls. In multiple-context mode, each context defines a single virtual firewall, complete with its own configuration. Each context acts as a unique virtual firewall that inspects and filters traffic traversing the interfaces allocated to that context. Each context is “unaware” of other contexts defined on the same security appliance.

As with a single-context, routed-mode device, interfaces on a multiple-context device connect to router-based networks, subinterfaces connect to switch-based networks, and each subinterface must be associated with an interface that routes allowed traffic correctly.

However, you cannot define IP addresses, the routed-mode portion of the configuration, or identify the management interface until you have defined and deployed the contexts. But you cannot define a security context until you have defined the necessary interfaces and subinterfaces.

In other words, you must enable and configure the interfaces and subinterfaces on a device that will provide multiple security contexts (in either routed or transparent mode) before you can define and configure the security contexts themselves.

Refer to [Chapter 57, “Configuring Security Contexts on Firewall Devices”](#) for more information.

## About Asymmetric Routing Groups

In some situations, return traffic for a session may be routed through a different interface than the one from which it originated. Similarly, in failover configurations, return traffic for a connection that originated on one unit may return through the peer unit. This most commonly occurs when two interfaces on a single FWSM, or two FWSMs in a failover pair, are connected to different service providers and the outbound connection does not use a NAT address. By default, the FWSM drops the return traffic because there is no connection information for that traffic.

You can prevent return traffic being dropped by assigning the VLAN interfaces on which this is likely to occur to an asymmetric routing (ASR) group. When a member interface receives a packet for which it has no session information, it checks the session information for other interfaces that are members of the same group.

If a match is not found, the packet is dropped. If a match is found, one of the following actions occurs:

- If the incoming traffic originated on a different interface on the same FWSM, some or all of the Layer 2 header is rewritten and the packet is re-injected into the stream.
- If the incoming traffic originated on a peer unit in a failover configuration, some or all of the Layer 2 header is rewritten and the packet is redirected to the other unit. This redirection continues as long as the session is active.

**Note**

In failover configurations, you must enable Stateful Failover for session information to be passed from the standby unit or failover group to the active unit or failover group.

To assign an FWSM virtual interface to an asymmetric routing group, simply specify an ASR Group ID in the [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), page 45-27. If the group does not exist, it is created and the interface assigned to it.

You must repeat the assignment for each interface that will participate in this ASR group. You can create up to 32 ASR groups and assign a maximum of eight interfaces to each group.

**Note**

The upstream and downstream routers must use one MAC address per VLAN, and have different MAC addresses for different VLANs, to allow the redirection of packets from a standby unit to an active unit in failover configurations.

## Understanding ASA 5505 Ports and Interfaces

The ASA 5505 is unique in that it includes a built-in switch, and there are two kinds of ports and interfaces that you need to configure:

- Physical switch ports – The ASA 5505 has eight Fast Ethernet switch ports that forward traffic at Layer 2, using the switching function in hardware. Two of these ports are power-over-Ethernet (PoE) ports. You can connect these ports directly to user equipment such as PCs, IP phones, or DSL modems. Or you can connect to another switch.
- Logical VLAN interfaces – In routed mode, these interfaces forward traffic between VLAN networks at Layer 3, using the configured security policy to apply firewall and VPN services. In transparent mode, these interfaces forward traffic between the VLANs on the same network at Layer 2, using the configured security policy to apply firewall services.

To segregate the switch ports into separate VLANs, you assign each switch port to a VLAN interface. Switch ports on the same VLAN can communicate with each other using hardware switching. But when a switch port on one VLAN attempts to communicate with a switch port on another VLAN, the ASA 5505 applies the security policy to the traffic, and routes or bridges between the two VLANs.

**Note**

Subinterfaces and redundant interfaces are not available on the ASA 5505.

### Navigation Path

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: *Hardware Ports* and *Interfaces*. To access these panels, select an ASA 5505 in Device View and then select **Interfaces** from the Device Policy selector.

### Configuring ASA 5505 Switch Ports and Interfaces

Refer to [Configuring Hardware Ports on an ASA 5505](#), page 45-39 for information about configuring the switch ports.

Refer to [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19 for information about configuring the interfaces.

### Related Topics

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 45-14

## Configuring Subinterfaces (PIX/ASA)

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN IDs. Because VLANs keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances. This feature is particularly useful in multiple-context mode, letting you assign unique interfaces to each context.

**Note**

If you use subinterfaces, you typically do not also want the physical interface to pass traffic, as the physical interface passes untagged packets. Because the physical interface must be enabled for the subinterface to pass traffic, do not name the physical interface to ensure it does not pass traffic. However, if you do want to let the physical interface pass untagged packets, you can name the interface as usual.

**Note**

This option is available only on PIX 7.0+ and non-5505 ASA devices.

### Defining Subinterfaces

Follow these steps to configure a subinterface in the Add/Edit Interface (ASA/PIX 7.0+) dialog box, which is accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 45-14).

1. Choose **Subinterface** as the interface **Type** in the Add/Edit Interface dialog box.

The VLAN ID and Subinterface ID fields appear below the Hardware Port, Name and Security Level fields.

2. Choose the desired **Hardware Port** from the list of previously defined interface ports. If you do not see a desired interface ID, be sure that Interface is defined and enabled.
3. **VLAN ID** – Provide a VLAN ID for this subinterface: enter a value between 1 and 4094. The specified VLAN ID must not be in use on any connected device.

Some VLAN IDs might be reserved on connected switches; see the switch documentation for more information. In multiple-context mode, you can only set the VLAN ID in the system configuration.

4. **Subinterface ID** – Provide an integer between 1 and 4294967293 as the Subinterface ID. The number of subinterfaces allowed depends on your platform.

For subinterface port identification, this ID is appended to the chosen Hardware Port. For example, *GigabitEthernet0.4* represents the subinterface assigned an ID of 4, operating on the port GigabitEthernet0.

**Note**

You cannot change the Subinterface ID after you set it.

5. Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19.

## Configuring Redundant Interfaces

Beginning with Security Manager 3.2.2, you can define logical “redundant” interfaces to increase security appliance reliability. A redundant interface is a specific pair of physical interfaces, with one designated as active (or primary) and the other as standby (or secondary). If the active interface fails, the

standby interface becomes active and starts passing traffic. This feature is separate from device-level failover, but you can configure redundant interfaces as well as failover, if desired. You can configure up to eight redundant interface pairs.

A redundant interface functions as a single interface (inside, outside, etc.), with only one of the member pair active at any one time. This redundant interface is configured normally, with a unique interface name, security level and IP address. Note that each member interface must be of the same type (e.g., GigabitEthernet), and cannot have a name, security level, or IP address assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.

The redundant interface uses the MAC address of the first physical interface that you specify. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can explicitly assign a MAC address to the redundant interface; this address is then used regardless of the member interface MAC addresses. In either case, when the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

**Note**

---

This option is available only on PIX 8.0+ and non-5505 ASA devices.

---

### Defining Redundant Interfaces

Follow these steps to configure two physical interfaces as a single logical “redundant interface” in the Add/Edit Interface (ASA/PIX 7.0+) dialog box, which is accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#)).

1. Choose **Redundant** as the interface **Type** in the Add/Edit Interface dialog box.  
The Redundant ID, Primary Interface and Secondary Interface options appear.
2. Provide an identifier for this redundant interface in the **Redundant ID** field; valid IDs are the integers from 1 to 8.
3. **Primary Interface** – Choose the primary member of the redundant interface pair from this list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.
4. **Secondary Interface** – Choose the secondary member of the redundant interface pair from this list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.

**Note**

---

Member interfaces must be enabled and of the same type (e.g., GigabitEthernet), and cannot have a Name, IP Address, or Security Level assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.

---

5. Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 45-19](#).

## Configuring EtherChannels

Beginning with ASA 8.4.1, you can define logical EtherChannel interfaces. An EtherChannel, also called a port-channel interface, is a logical interface consisting of a bundle of individual Ethernet links (a channel group). This provides increased bandwidth and fault tolerance compared to the individual links.

An EtherChannel interface is configured and used in the same manner as a single physical interface. You can configure up to 48 EtherChannels, each of which consists of between one and eight active Fast Ethernet, Gigabit Ethernet, or Ten-Gigabit Ethernet ports.

**Note**

You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the ASA if they do not use the same physical interfaces.

**EtherChannel MAC Addressing**

All interfaces that are part of a channel group share the same MAC address. This makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. By default, the EtherChannel uses the MAC address of the lowest-numbered member interface as its MAC address.

Alternatively, you can manually configure a MAC address for the port-channel interface. We recommend doing so in case the channel interface membership changes. For example, if you remove the interface that provides the port-channel MAC address, the port-channel is assigned the MAC address of the next lowest numbered interface, causing traffic disruption. Manually assigning a unique MAC address to the EtherChannel interface prevents this disruption. (Note that in multiple-context mode, you can assign unique MAC addresses to interfaces assigned to an individual context, including EtherChannel interfaces.)

**About Management Only EtherChannel Interfaces**

You can specify an EtherChannel group as a management-only interface, but note the following caveats:

- Routed mode – You must explicitly configure the EtherChannel to be Management Only in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 45-19](#). Any non-management interface added to the management-only port-channel is treated as a management port. If you add an interface already defined as management-only to the management-only group, that attribute is ignored on the physical interface. Similarly, you cannot designate an interface as management-only if it is already a member of a management-only port-channel.
- Transparent mode – In this mode, members of a management-only EtherChannel can themselves only be management-only ports. Thus, when a management-only member is added to a transparent-mode EtherChannel, the channel inherits the management-only designation, while the designation is removed from the member interface. Conversely, when such an interface is removed from the EtherChannel, the designation is restored on the individual interface.

**Using an EtherChannel Interface as a Failover Link**

If an EtherChannel interface is specified as a failover link, all state-sync traffic for that link will travel over a single physical interface. Should that physical interface fail, the state-sync traffic will then traverse another physical interface that is part of the EtherChannel aggregated link. If there are no remaining available physical interfaces in the EtherChannel link specified for failover, the ASA falls back to the redundant interface, if one is specified.

While an EtherChannel interface is being used as an active failover link, changes to that EtherChannel configuration are not allowed. You can change the EtherChannel configuration of that link only by disabling either the link or failover, as follows:

- Disable the EtherChannel link while the configuration changes are being made, and then reactivate it (failover will not occur while the link is disabled).

- Disable failover while the configuration changes are being made, and then re-enable it (failover will not occur in the interim).

**Note**

As with any other type of interface assigned as a failover link, the EtherChannel interface cannot be named. Further, none of the EtherChannel's member interfaces can be named.

**Defining EtherChannels on an ASA**

Follow these steps to configure multiple physical interfaces as a single logical EtherChannel interface in the ASA Add Interface or Edit Interface dialog boxes, which are accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#)).

**Step 1** Choose **EtherChannel** as the interface Type.

The EtherChannel ID and interface-selection options appear on the General panel of the dialog box; the Load Balancing, LACP Mode, and Active Physical Interfaces: Minimum and Maximum fields appear on the Advanced panel.

**Step 2** Provide an identifier for this EtherChannel in the EtherChannel ID field; valid IDs are the integers from 1 to 48. This number is appended to "Port-channel" to identify the EtherChannel in the Interface column of the table on the device's Interfaces page.

**Step 3** **Available Interfaces** – Specify the members of this port-channel group by select one or more interfaces in this list of available interfaces, and then click the >> button to add them to the member list on the right.

**Note**

All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

You can assign up to 16 interfaces to a channel group. In a standard EtherChannel, up to eight of these interfaces can be active, while the remaining interfaces act as stand-by links in case of individual interface failure. Alternatively, you can create a static EtherChannel by setting LACP Mode to On (on the Advanced panel, as described below), which means all interfaces in the group can pass traffic.

**Note**

After assigning interfaces to this EtherChannel group, you can edit the LACP Port parameters for each member interface, as described in [Editing LACP Parameters for an Interface Assigned to an EtherChannel, page 45-11](#).

**Step 4** Click the **Advanced** tab to display that panel.

**Step 5** Choose a **Load Balancing** option in the EtherChannel section. See [About EtherChannel Load Balancing, page 45-12](#), for more information about this option.

**Step 6** Select the desired **LACP Mode**; the default is Active, which means up to eight interfaces are active, while up to eight are in stand-by mode, as determined by the Minimum and Maximum values under Active Physical Interfaces.

If you select On, a static port-channel is created in which all member interfaces are all "on," meaning you can have up to 16 ports passing traffic, with no stand-by ports. When you select this option, the Mode for all interfaces assigned to this EtherChannel group is switched to On (if the Mode for each is not already On). See [Editing LACP Parameters for an Interface Assigned to an EtherChannel, page 45-11](#), for more information about this mode.

**Step 7** Specify the Minimum and Maximum number of Active Physical Interfaces for this EtherChannel.

As mentioned, an EtherChannel can consist of between one and eight active links, with up to 16 assigned to the group (on the General panel). Use these fields to indicate the minimum and maximum number of interfaces that can be active in this channel group at any given time.

- Step 8** Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19.

**Note** The EtherChannel **LACP System Priority** for this device is specified in the [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 45-42 dialog box.

## Editing LACP Parameters for an Interface Assigned to an EtherChannel

After assigning interfaces to an EtherChannel (port-channel) group, you can edit the LACP Port parameters for each member interface, as described here.

**Note** This feature is available only on ASA 8.4.1+ devices.

The Link Aggregation Control Protocol (LACP) directs aggregation of physical Fast Ethernet, Gigabit Ethernet, or Ten-Gigabit Ethernet interfaces into an EtherChannel group, and updating the remote partner device with current information after it finds a compatible set of ports and assigns a unique value called an “operational key” to the group. Note that operational key assignment is automatic; you cannot configure it.

**Caution** These LACP parameters are not available when the EtherChannel is assigned as a failover link.

### LACP System Priority

Every LACP-enabled device has a unique system ID that is formed by combining a System Priority identifier and the system’s MAC address. In certain situations, two EtherChannel-linked systems may need to change the operational key assigned to a set of ports to allow optimal aggregation. In such a situation, the system with higher priority is allowed to dynamically modify the operational key value assigned to the ports to achieve better aggregation. The system with the lower priority is not allowed to change the operational keys. The System Priority identifier is user-configurable, as described in [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), page 45-42.

### LACP Port Parameters

Port identification is provided by a unique number assigned to every group interface; this identifier is formed by combining a configurable Port Priority number and the port number assigned to the interface.

The port identifier provides port aggregation priority. Ports are considered for active use in an aggregation starting with the port that has highest aggregation priority in the system, and working down through an ordered list of port identifiers. The use of this port aggregation priority makes aggregation predictable and reproducible by selecting the links for aggregation in the same manner when all links are running LACP concurrently.

In addition, you can configure the priority of each port to administratively control the set of stand-by ports. For example, the port with the lowest priority will be considered last for group aggregation and will become a stand-by port (assuming enough members are assigned to the group to allow stand-by ports).

**Related Topics**

- [Configuring EtherChannels, page 45-8](#)

**Editing LACP Port Parameters for an Existing EtherChannel Interface**

Follow these steps to edit an existing EtherChannel-assigned interface:

- 
- Step 1** In the table on the device's Interfaces page, select an interface that is a Member of a Port-channel group. (See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#) for information about accessing and using this table.)
- Step 2** Click **Edit Row** to open the Edit Interface dialog box for that interface.
- Only the Enable Interface check box, the LACP Port parameters, and the Description field can be altered.
- Step 3** Edit the **LACP Port** parameters as necessary:
- **Priority** – This number is combined with the port number assigned to the interface to produce a unique port identification number. This value can be 1 to 65535, with higher numbers signifying lower priorities. The default is 32768. This parameter applies only when the port is in Active or Passive mode.
  - **Mode** – Choose one of these LACP modes:
    - **Active** – In Active mode, a port initiates LACP exchanges with the partner device and periodically sends updates to the partner. Active LACP reflects the port's preference to participate in the protocol regardless of the partner's control mode.
    - **Passive** – A Passive-mode port does not initiate LACP exchanges, but upon receiving a request from the partner, the port will start exchanging LACP information with the partner. Passive mode is useful when it is not clear if the remote port supports LACP.

Some devices may show undesired behavior when they do not have LACP enabled and they receive periodic LACP updates. However, for channeling to operate correctly, at least one port must be configured in Active mode.

    - **On** – Use this mode to configure a static port-channel in which all member interfaces are “on,” meaning up to 16 ports are passing traffic, with no stand-by ports. No negotiation takes place and most restrictions associated with the other two modes do not apply; for example, the speed and duplex settings do not have to be the same for all member ports, and all member ports (up to 16) remain Active. Note that the remote ports also must be On.
  - **VSS or vPC Switch ID** – Identifies the Virtual Switching System (VSS) or Virtual Port Channel (vPC) switch ID to which the interface is connected.
- Step 4** Continue editing this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 45-19](#).
- 

**About EtherChannel Load Balancing**

Traffic in an EtherChannel is distributed across the individual bundled links in a deterministic fashion; however, the load is not necessarily balanced equally across all the links. Instead, frames are forwarded on a specific link as a result of a hashing algorithm. This algorithm uses a specific field or combination of fields in the packet header to produce a fixed Result Bundle Hash (RBH) value that indicates which link to use.

The algorithm can use one or a combination of the following packet-header fields to determine link assignment: source IP address, destination IP address, source MAC address, destination MAC address, TCP/UDP port numbers, or VLAN IDs. The field combination used by the algorithm is chosen from the **Load Balancing** list (on the Advanced tab of the ASA's Add Interface and Edit Interface dialog boxes); these options are described in the following section. For additional information, see [Configuring EtherChannels, page 45-8](#).

For example, suppose source MAC address (*src-mac*) is the chosen field: when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source MAC address of each incoming packet. Therefore, to provide load balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel (and the MAC addresses learned by the device do not change).

Similarly, with destination MAC address forwarding, when packets are forwarded to an EtherChannel, each packet is distributed across the ports in the channel based on the packet's destination host MAC address. Thus, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

Therefore, when choosing a load-balancing option, use the option that provides the greatest variety in your configuration. For example, if most of the traffic on a channel is going only to a single MAC address, choosing the destination MAC address results in most of the traffic always using the same link in the channel. Alternatively, using source addresses or IP addresses might result in better load balancing, while a method that uses the source and destination addresses along with UDP or TCP port numbers can distribute traffic much differently.

**Note**

---

This option is available only on ASA 8.4.1+ devices.

---

**Load Balancing Options**

When defining a single logical EtherChannel interface in the ASA Add/Edit Interface dialog box, choose one of the following **Load Balancing** options (on the [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), page 45-27) to specify the basis of load distribution:

- **dst-ip** – Load distribution is based on the destination-host IP address only; the source of the packets is not considered. Each packet with the same destination IP address is forwarded over the same link.
- **dst-ip-port** – Load distribution is based on the destination-host IP address and TCP/UDP port. This option offers more granularity and a little more complexity than destination IP address alone.
- **dst-mac** – Load distribution is based on the destination host MAC address of incoming packets.
- **dst-port** – Distribution is based on the destination port; that is, a TCP or UDP port and not a physical interface.
- **src-dst-ip** – Distribution is based on source and destination IP addresses—source and destination IP addresses are paired for hash calculations. This method provides more granularity than destination IP address, for example: packets to the same destination can be forwarded over different links in a port-channel if they are coming from a different IP source.
- **src-dst-ip-port** – Distribution calculation considers source and destination IP addresses, and TCP/UDP ports. Provides even greater granularity and distribution.
- **src-dst-mac** – Calculation is based on source and destination MAC address pairing.
- **src-dst-port** – Load distribution is based on source and destination TCP/UDP port.
- **src-ip** – Based on source host IP address only.
- **src-ip-port** – Source IP address and TCP/UDP port.
- **src-mac** – Source MAC address only.

- **src-port** – Source TCP/UDP port only.
- **vlan-dst-ip** – Destination IP address and VLAN ID pairing.
- **vlan-dst-ip-port** – Combination of destination IP address, TCP/UDP port, and VLAN ID.
- **vlan-only** – VLAN ID only.
- **vlan-src-dst-ip** – Source and destination IP address, and VLAN ID.
- **vlan-src-dst-ip-port** – Source and destination IP address, TCP/UDP port, and VLAN ID.
- **vlan-src-ip** – Source IP address and VLAN ID.
- **vlan-src-ip-port** – Source IP address, TCP/UDP port, and VLAN ID.

## Managing Device Interfaces, Hardware Ports, and Bridge Groups

The Interfaces page displays the interfaces, subinterfaces, redundant interfaces, virtual interfaces (VLANs), and EtherChannel interfaces, as well as the hardware ports and bridge groups, configured on the selected device, and lets you add, edit and delete them.

The types of interface available depend on device type, operating system version, and mode (routed or transparent). For example, EtherChannel interfaces are available only on ASA 8.4.1 and later devices, in both routed and transparent mode. See [Understanding Device Interfaces, page 45-3](#) for more information.

### Note

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: **Interfaces** and **Hardware Ports**. Similarly, the Interfaces page displayed for both Firewall Services Modules (FWSMs), version 3.1 and later, and ASAs version 8.4.1 and later, operating in transparent mode also present two tabbed panels: **Interfaces** and **Bridge Groups**. Links to configuration information for these features are included in the following procedure.

Each security device must be configured, and each active interface must be enabled. Inactive interfaces can be disabled. When disabled, the interface does not transmit or receive data, but its configuration information is retained.

If you bootstrapped a new security device, the set-up feature configures only the addresses and names associated with the inside interface. You must define the remaining interfaces on that device before you can specify access and translation rules for traffic traversing that security device.

Transparent firewall mode allows only two interfaces to pass traffic; however, if your platform includes a dedicated management interface, you can use it (either the physical interface or a subinterface) as a third interface for management traffic.

Follow these general steps to manage security-device interfaces and related options. You can add, edit and delete configured interfaces, subinterfaces, redundant interfaces, virtual interfaces (VLANs), EtherChannel interfaces, hardware ports, and bridge groups, according to the type of device selected.

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

### Note

For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager, page 5-28](#).

**Step 2** Select the security device you want to configure.

**Step 3** Select **Interfaces** in the Device Policy selector.

The Interfaces page is displayed. The information displayed, and the page itself, varies based on the selected device type and version, the operational mode (routed versus transparent), and whether the device hosts single or multiple contexts.

Note that the Interfaces page for ASA 5505 devices presents two tabbed panels: Hardware Ports and Interfaces. Similarly, the Interfaces page displayed for both FWSMs (version 3.1 and later) and ASAs (version 8.4.1 and later), operating in transparent mode also presents two tabbed panels: Interfaces and Bridge Groups.

**Step 4** Add, edit and delete interfaces and related options, as necessary.

The Interfaces pages/panels and the Bridge Groups and Hardware Ports panels present standard Security Manager tables, with Add Row, Edit Row and Delete Row buttons, which are described in [Using Tables, page 1-45](#).

The actual dialog box presented when you click the Add Row or Edit Row button depends on the type of device (and panel) you have selected. Refer to the following topics for device-specific dialog box information:

- [Add/Edit Interface Dialog Box \(PIX 6.3\), page 45-15](#)
- [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 45-19](#)
- [Configuring Hardware Ports on an ASA 5505, page 45-39](#)
- [Add/Edit Bridge Group Dialog Box, page 45-41](#)

**Step 5** To manage Advanced Interface settings, including enabling communication between interfaces with the same security level, click the Advanced button at the bottom of the Interfaces page to open the Advanced Interface Settings dialog box. See [Advanced Interface Settings \(PIX/ASA/FWSM\), page 45-42](#) for more information.

**Step 6** When you are finished adding, editing and deleting interfaces, click **Save** at the bottom of the window to save your interface definitions to the Cisco Security Manager server.

## Add/Edit Interface Dialog Box (PIX 6.3)

**Table 45-2** Add/Edit Interface Dialog Box (PIX 6.3)

| Element          | Description                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | Enables this interface to pass traffic. In addition to this setting, you must specify an IP Type and a Name before traffic can pass according to your security policy.<br><br>You must enable a physical interface before traffic can pass through any enabled subinterfaces. |
| Type             | Choose the type of interface: <ul style="list-style-type: none"> <li>• <b>Physical</b> – VLAN is on the same network as its underlying hardware interface.</li> <li>• <b>Logical</b> – VLAN is associated with a logical interface.</li> </ul>                                |

Table 45-2 Add/Edit Interface Dialog Box (PIX 6.3) (Continued)

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name          | <p>Provide an interface name up to 48 characters in length. The Name should be a memorable name for the interface that relates to its use. Supported interface names are:</p> <ul style="list-style-type: none"> <li>• Inside—Connects to your internal network. Must be most secure interface.</li> <li>• DMZ—Demilitarized zone (Intermediate interface). Also known as a perimeter network.</li> <li>• Outside—Connects to an external network or the Internet. Must be least secure interface.</li> </ul>                                                                                                                      |
| Hardware Port | <p>When defining a physical network interface, this value represents the name identifies the interface type and its slot or port in the device.</p> <p>When you add a logical network interface, you can choose any enabled physical interface to which you want to add a logical interface. If you do not see the desired hardware port, verify that the interface is enabled.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• ethernet0 to ethernet<math>n</math>.</li> <li>• gb-ethernet<math>n</math>.</li> </ul> <p>where <math>n</math> represents the number of network interfaces in the device.</p> |
| IP Type       | <p>The IP Type defines the type of IP addressing used for the interface; choose <b>Static IP</b> or <b>Use DHCP</b>, as described in <a href="#">Device Interface: IP Type (PIX 6.3), page 45-18</a>. (The PPPoE option is not applicable to PIX 6.3 devices.)</p> <p><b>Note</b> You can configure DHCP only on the outside interface of a security appliance.</p>                                                                                                                                                                                                                                                                |

Table 45-2 Add/Edit Interface Dialog Box (PIX 6.3) (Continued)

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed and Duplex | <p>Lists the speed options for a physical interface; not applicable to logical interfaces. Choose one of the following options:</p> <ul style="list-style-type: none"> <li>• auto – Sets Ethernet speed automatically. The auto keyword can be used only with the Intel 10/100 automatic speed-sensing network interface card.</li> <li>• 10baset – 10-Mbps Ethernet half-duplex.</li> <li>• 10full – 10-Mbps Ethernet full-duplex.</li> <li>• 100basetx – 100-Mbps Ethernet half-duplex.</li> <li>• 100full – 100-Mbps Ethernet full-duplex.</li> <li>• 1000auto – 1000-Mbps Ethernet to auto-negotiate full- or half-duplex.</li> </ul> <p><b>Tip</b> We recommend that you do not use this option to maintain compatibility with switches and other devices in your network.</p> <ul style="list-style-type: none"> <li>• 1000full – Auto-negotiate, advertising 1000-Mbps Ethernet full-duplex.</li> <li>• 1000full nonnegotiate – 1000-Mbps Ethernet full-duplex.</li> <li>• au1 – 10-Mbps Ethernet half-duplex communication with an AUI cable interface.</li> <li>• bnc – 10-Mbps Ethernet half-duplex communication with a BNC cable interface.</li> </ul> <p><b>Note</b> We recommend that you specify the speed of the network interfaces in case your network environment includes switches or other devices that do not handle autosensing correctly.</p> |
| MTU              | Specify the maximum packet size in bytes; that is, the maximum transmission unit (MTU). The value depends on the type of network connected to the interface. Valid values are 300 to 65535 bytes. Default is 1500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Physical VLAN ID | For a physical interface, enter the VLAN ID, between 1 and 4094. This VLAN ID must not be in use on connected devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Logical VLAN ID  | Provide the alias, a value between 1 and 4094, for the VLAN associated with this logical interface. This value is required if the logical interface Type is selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Security Level   | <p>Specify the security level of the interface: enter a value between 0 (least secure) and 100 (most secure). The security appliance lets traffic flow freely from an inside network to an outside network (lower security level). Many other security features are affected by the relative security level of two interfaces.</p> <ul style="list-style-type: none"> <li>• The <i>outside</i> interface is always 0.</li> <li>• The <i>inside</i> interface is always 100.</li> <li>• DMZ interfaces are between 1 and 99.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 45-2 Add/Edit Interface Dialog Box (PIX 6.3) (Continued)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Roles   | <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects, page 6-67</a>.</p> <p>All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager.</p> <p>Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces.</p> <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects, page 6-67</a>.</p> |

### Device Interface: IP Type (PIX 6.3)

A PIX 6.3 security device requires IP addressing for its interfaces; however, firewall interfaces do not have IP addresses until you assign them.

The Add/Edit Interface dialog box presented for a PIX 6.3 security device includes the section **IP Type**, where you specify the type of IP addressing for the interface and provide related parameters, as described here. See [Add/Edit Interface Dialog Box \(PIX 6.3\), page 45-15](#) for information about the other sections of the dialog box.

#### Note

The IP Type options presented for other security appliances are described in [Device Interface: IP Type \(PIX/ASA 7.0+\), page 45-36](#).

#### Step 1

In the Add/Edit Interface dialog box, choose a method for address assignment from the **IP Type** list, and then provide related parameters, as follows:

- **Static IP** – Provide a static **IP Address** and **Subnet Mask** that represents the security device on this interface's connected network. The IP address must be unique for each interface.

The Subnet mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24). Do not use 255.255.255.254 or 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface. If you omit the Subnet Mask value, a “classful” network is assumed, as follows:

- The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (i.e., addresses 1.0.0.0 through 126.255.255.255).
- The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (i.e., addresses 128.0.0.0 through 191.255.255.255).
- The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (i.e., addresses 192.0.0.0 through 223.255.255.255).

#### Note

Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

- **Use DHCP** – Enables Dynamic Host Configuration Protocol (DHCP) for automatic assignment of an IP address from a DHCP server on the connected network. The following options become available:
  - **Obtain Default Route using DHCP** – Check this box to obtain a default route from the DHCP server so that you do not need to configure a default static route.
  - **Retry Count** – The number of times the PIX will resend the DHCP request. Valid values are 4 to 16; the default is 2
- **PPPoE (PIX and ASA 7.2+)** – This option does not apply to PIX 6.3 devices.

**Note** You can configure DHCP only on the outside interface of a firewall device.

## Add/Edit Interface Dialog Box (PIX 7.0+/ASA/FWSM)

These Add Interface and Edit Interface dialog boxes are used to define and configure interfaces, subinterfaces, redundant, and EtherChannel interfaces on PIX 7.0+, ASA, and FWSM devices. You can access the Add/Edit Interface dialog boxes from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#) for more information.

**Note**

The ASA 5505, combining switch and security appliance features, is a special case in that you configure both physical switch ports and logical VLAN interfaces. Thus, the Interfaces page displayed for ASA 5505 devices presents two tabbed panels: **Hardware Ports** and **Interfaces**. See [Understanding ASA 5505 Ports and Interfaces, page 45-6](#) for more information.

ASA 8.4.1+ and FWSM 3.1+ devices operating in transparent mode also present two tabbed panels: **Interfaces** and **Bridge Groups**. See [Add/Edit Bridge Group Dialog Box, page 45-41](#) for information about configuring bridge groups.

Many of the parameters presented in these dialog boxes vary according to device type and version, operational mode (routed versus transparent), and whether the device hosts a single or multiple contexts.

**Note**

If you intend to use an interface for failover, you can define that interface in the Add Interface dialog box but do not configure it; instead, use the Failover page (see [Chapter 49, “Configuring Failover”](#)). In particular, do not specify an interface Name, as this parameter disqualifies the interface from being used as the failover link.

### Using the Add Interface and Edit Interface Dialog Boxes

The following steps outline the general use of these dialog boxes:

1. An interface Type drop-down list appears at the top of the Add Interface and Edit Interface dialog boxes.

**Note**

Catalyst 6500 services modules (ASA-SMs and FWSMs) and the ASA 5505 do not present the Type list.

Depending on device type, operating-system version and operating mode (router or transparent), the Type options presented will be two, three or all of the following:

- **Physical Interface** – Choose this option to configure a physical interface on the device.
  - **Sub-Interface** – Choose this option to configure a logical interface (or VLAN connection) associated with a previously defined physical interface. Refer to [Configuring Subinterfaces \(PIX/ASA\), page 45-7](#) for more information.
  - **Redundant** – Choose this option to configure two physical interfaces as a single logical “redundant interface.” Refer to [Configuring Redundant Interfaces, page 45-7](#) for more information.
  - **EtherChannel** – Choose this option to configure a logical interface consisting of a bundle of up to eight individual Ethernet links; this bundle is known as an EtherChannel, or a port-channel interface. (This option is available only on ASA 8.4+ devices.) Refer to [Configuring EtherChannels, page 45-8](#), for more information.
2. Below the Type option, the dialog boxes present up to three tabbed panels. Again, this depends on device type, operating-system version and operating mode.

The PIX 7.0+ Add Interface and Edit Interface dialog boxes present two tabbed panels: General and Advanced. The ASA 7.0+ Add Interface and Edit Interface dialog boxes present three tabbed panels: General, Advanced and IPv6.

- Configure the General options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: General Tab \(PIX 7.0+/ASA/FWSM\), page 45-20](#).
  - Configure the Advanced-panel options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\), page 45-27](#).
  - Configure the IPv6 options, as appropriate. This panel is described in [Configuring IPv6 Interfaces \(ASA/FWSM\), page 45-29](#).
3. When you have finished configuring this interface, click **OK** to close the dialog box and return to the device Interfaces page.

### Add/Edit Interface Dialog Box: General Tab (PIX 7.0+/ASA/FWSM)

The [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\), page 45-19](#), is used to define and configure interfaces, subinterfaces, VLAN interfaces, and redundant, and EtherChannel interfaces on firewall devices. You can access the Add/Edit Interface dialog box from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#) for more information.

#### Note

In the following descriptions, the term “interface” may be used generically to refer to any of these types of interface.

The General panel of this dialog box is used to configure general interface settings, including Name, Security Level and IP Type parameters. Note that many of the parameters presented in this panel vary according to device type and version, operational mode (routed versus transparent), and whether the device hosts a single or multiple contexts. Thus, some of the options in the following table may not appear for the device you are configuring.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | <p>Enables this interface to pass traffic.</p> <p>By default, all physical interfaces are shut down. Traffic cannot traverse an interface of any type if the interface is not enabled. If you are defining a logical interface such as a subinterface, enable the physical interface it will be associated with before defining the subinterface. If you are defining a redundant interface or an EtherChannel interface, enable the member interfaces before defining the group interface.</p> <p>When you check this option, you must also specify a Name and, in routed mode, an IP Type (or IP Address and Subnet Mask on an FWSM or ASA-SM) before traffic can pass according to your security policy.</p> <p>In multiple-context mode, if you allocate a physical or logical interface to a context, the interface is enabled by default in the context. However, before traffic can pass through the context interface, you must also enable the interface in the system configuration. If you shut down an interface in the system execution space, that interface is shut down in all contexts in which it shared.</p> |
| Management Only  | <p>Reserves this interface for device administration. Only traffic for management of this device is accepted; pass-through traffic for other interfaces and devices is rejected.</p> <p>You cannot set a Primary or Secondary ISP interface to be Management Only.</p> <p>Defining a management-only EtherChannel interface has certain member-interface restrictions. See <a href="#">Configuring EtherChannels</a>, page 45-8, for more information.</p> <p><b>Note</b>    Not available on devices in transparent mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | <p>On the ASA 5505, the Hardware Port is specified on the Hardware Ports panel (see <a href="#">Configuring Hardware Ports on an ASA 5505, page 45-39</a>). Also, this option is not part of Catalyst 6500 services module (ASA-SM and FWSM) configuration.</p> <p>For a physical interface, provide the specific hardware port assigned to the interface: enter a physical port ID, which includes network type, slot and port number, in the form: <i>type[slot/]port</i>. This is also the name by which subinterfaces can be associated with the interface.</p> <p>The network type specified for the physical interface can be either Ethernet or GigabitEthernet; on the ASA 5580, TenGigabitEthernet is also available. This field provides automatic pattern matching: if you begin typing with the letter e, “Ethernet” is inserted into the field. Similarly, typing the letter g produces “GigabitEthernet.” Therefore, valid values are:</p> <ul style="list-style-type: none"> <li>• Ethernet0 to Ethernet<i>n</i></li> <li>• GigabitEthernet0 to GigabitEthernet<i>n</i></li> <li>• GigabitEthernets/<i>n</i></li> <li>• TenGigabitEthernets/<i>n</i> (ASA 5580 only)</li> </ul> <p>where <i>s</i> represents a slot number, and <i>n</i> represents a port number, up to the maximum number of network ports in the slot or device.</p> <p>For an ASA 5500 series appliance, enter the type and a slot/port pair; for example, <i>gigabitethernet0/1</i>. Ports that are built into the chassis are assigned to slot 0, while ports on the 4-Port Gigabit Ethernet Security Services Module (4GE SSM) are assigned to slot 1. When you enter a slot/port pair, the Media Type options are enabled.</p> <p>The ASA 5500 series appliances also include a <b>management</b> interface type. The management interface is a Fast Ethernet interface designed for device-management traffic only, and is specified as <i>management0/0</i>. You can, however, use this physical interface for through traffic if desired (be sure the Management Only option is not selected). Thus, in transparent firewall mode, you can use the management interface in addition to the two interfaces allowed for through traffic. You can also add subinterfaces to the management interface to provide management in each security context in multiple-context mode.</p> <p>If you are defining a subinterface, you can simply choose the desired Hardware Port from a list of previously defined ports (you must also supply a VLAN ID). If you do not see a desired interface ID, be sure that Interface is defined and enabled.</p> |

**Table 45-3** General tab: Add/Edit Interface Dialog Box (Continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name           | <p>Provide an identifier for this interface of up to 48 characters in length. The name should be a memorable name for the interface that relates to its use. However, if you are using failover, do not name interfaces that you are reserving for failover communications; this includes an EtherChannel intended for failover, as well as its member interfaces. Also, do not name interfaces intended for use as a member of a redundant-interface pair.</p> <p>Certain names are reserved for specific interfaces, in accordance with the interface naming conventions of the security appliance. As such, these reserved names enforce default, reserved security levels, as follows:</p> <ul style="list-style-type: none"> <li>• Inside – Connects to your internal network. Must be the most secure interface.</li> <li>• DMZ – “Demilitarized zone” attached to an intermediate interface. DMZ is also known as a perimeter network. You can name a DMZ interface any name you choose. Typically, DMZ interfaces are prefixed with “DMZ” to identify the interface type.</li> <li>• Outside – Connects to an external network or the Internet. Must be the least secure interface.</li> </ul> <p>Similarly, a subinterface name typically identifies its associated interface, in addition to its own unique identifier. For example, <i>DMZoobmgmt</i> could represent an out-of-band management network attached to the DMZ interface.</p> <p><b>Note</b> Again, <b>do not name the interface if you intend to use it for failover, or as a member of a redundant interface.</b> See <a href="#">Chapter 49, “Configuring Failover”</a> and <a href="#">Configuring Redundant Interfaces, page 45-7</a> for more information.</p> |
| Security Level | <p>Specify the security level of the interface: enter a value between 0 (least secure) and 100 (most secure). The security appliance lets traffic flow freely from an inside network to an outside network (lower security level). Many other security features are affected by the relative security level of two interfaces.</p> <ul style="list-style-type: none"> <li>• The <i>outside</i> interface is always 0.</li> <li>• The <i>inside</i> interface is always 100.</li> <li>• DMZ interfaces are between 1 and 99.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Media Type      | <p>When Interface is the chosen Type and you enter a hardware port ID with slot/port numbers in the Hardware Port field, these options are enabled. (These options apply to ASA slot/port interfaces only.)</p> <p>For all ASA 5500 series appliances, except the 5505, ports that are built into the chassis are assigned to slot 0, while ports on the 4GE SSM are assigned to slot 1. By default, all connectors used on an ASA are RJ-45 connectors. However, the ports on the 4GE SSM can include fiber SFP connectors. As part of the interface configuration for one of these fiber-based connections, you must change the Media Type setting from the default (RJ45) to the fiber-connector setting (SFP).</p> <p>Fiber-based interfaces do not support duplexing and have a fixed speed, so the Duplex option is disabled, and the Speed options are limited to auto and nonegotiate.</p> <p>Select the connector type used by this slot-1 interface:</p> <ul style="list-style-type: none"> <li>• <b>RJ45</b> – The port uses RJ-45 (copper) connectors.</li> <li>• <b>SFP</b> – The port uses fiber SFP connectors. Required for 10-Gigabit Ethernet cards.</li> </ul> |
| VLAN ID         | <p>When Subinterface is the chosen interface Type, or when you are defining a logical interface on a device operating in transparent mode, on an ASA 5505, or on a Catalyst 6500 services module (ASA-SM or FWSM), provide a VLAN ID for this interface.</p> <p>For PIX/ASA devices running operating system 7.2(2)18 or earlier, valid VLAN IDs are 1 to 1001; with version 7.2(2)19 or later, valid IDs are 1 to 4090. For Catalyst 6500 services modules, valid IDs are 1 to 4096. The specified VLAN ID must not be in use on any connected device.</p> <p>Some VLAN IDs might be reserved on connected switches; see the switch documentation for more information. In multiple-context mode, you can only set the VLAN ID in the system configuration.</p> <p>See <a href="#">Configuring Subinterfaces (PIX/ASA)</a>, page 45-7 for more information.</p>                                                                                                                                                                                                                                                                                                                  |
| Subinterface ID | <p>When Subinterface is the chosen interface Type, or when defining an interface on a device operating in transparent mode, provide an integer between 1 and 4294967293 as the Subinterface ID.</p> <p>For subinterface port identification, this ID is appended to the chosen Hardware Port. For example, <i>GigabitEthernet0.4</i> represents the subinterface assigned an ID of 4, operating on the port GigabitEthernet0.</p> <p><b>Note</b> You cannot change the Subinterface ID after you set it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| IP Type         | <p><b>PIX 7.0+ and ASA (except the 5505 in transparent mode) only.</b></p> <p>The IP Type defines the type of IP addressing used for the interface; choose <b>Static IP</b>, <b>Use DHCP</b>, or <b>PPPoE</b> (as described in <a href="#">Device Interface: IP Type (PIX/ASA 7.0+)</a>, page 45-36).</p> <p><b>Note</b> You can configure DHCP and PPPoE only on the outside interface of a security appliance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Interface<br>Secondary Interface                                     | <p>When Redundant Interface is the chosen interface Type, choose the primary member of the redundant interface pair from the Primary Interface list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.</p> <p>Similarly, choose the secondary member of the redundant interface pair from the Secondary Interface list of available interfaces.</p> <p><b>Note</b> Member interfaces must be enabled and of the same type (e.g., GigabitEthernet), and cannot have a Name, IP Address, or Security Level assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.</p>                                                                         |
| <b>These options available on ASA 5505 devices only.</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Block Traffic To                                                             | Restricts this VLAN interface from initiating contact with the VLAN chosen here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Backup Interface                                                             | Choose a VLAN interface as a backup interface, for example, to an ISP. The backup interface does not pass traffic unless the default route through the primary interface fails. To ensure that traffic can pass over the backup interface, be sure to configure default routes on both the primary and backup interfaces so that the backup interface can be used when the primary fails.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Active MAC Address<br>Standby MAC Address                                    | <p>Use the Active MAC Address field to manually assign a private MAC address to the interface; the Standby MAC Address field can be used to set a standby MAC address for use with device-level failover.</p> <p>Refer to <a href="#">Device Interface: MAC Address, page 45-38</a> for more information about these fields.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>EtherChannel Interface options; available on ASA 8.4.1+ devices only.</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EtherChannel ID                                                              | When EtherChannel is the chosen interface Type, enter an identifier for this EtherChannel (also referred to as a “port-channel”). Valid values are 1 to 48—you can define up to 48 port-channel groups. See <a href="#">Configuring EtherChannels, page 45-8</a> , for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Available Interfaces/Members in Group                                        | <p>When EtherChannel is the chosen interface Type, you can assign interfaces to this EtherChannel group by selecting them in the Available Interfaces list and then clicking the &gt;&gt; button to add them to the members list to the right.</p> <p>Each channel group can have up to eight active interfaces, although you can assign up to 16 interfaces to the group. While only eight interfaces can be active, the remaining interfaces act as stand-by links in case of individual interface failure.</p> <p><b>Note</b> All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the type and speed for the group.</p> <p>See <a href="#">Configuring EtherChannels, page 45-8</a>, for more information.</p> |

### Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+)

The [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19, is used to define and configure interfaces, subinterfaces, redundant, and EtherChannel interfaces on ASA and PIX 7.0+ devices. You can access the Add/Edit Interface dialog box from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 45-14 for more information.

The Advanced panel of this dialog box is used to configure basic interface settings, including Duplex, Speed, and maximum transmission unit (MTU) parameters, as described in the following table.

| Roles                                                                                                                                         | <p>All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager.</p> <p>Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces.</p> <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects, page 6-67</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>EtherChannel Interface options; available on ASA 8.4.1+ devices only.</b>                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Load Balancing                                                                                                                                | <p>When EtherChannel is the chosen interface Type (on the General panel), choose a load-balancing method for the channel links. See <a href="#">About EtherChannel Load Balancing, page 45-12</a>, for more information about this option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LACP Mode                                                                                                                                     | <p>Select the desired <b>LACP Mode</b>; the default is Active, which means up to eight interfaces are active, while up to eight are in stand-by mode, as determined by the Minimum and Maximum values under Active Physical Interfaces.</p> <p>If you select On, a static port-channel is created in which all member interfaces are all “on,” meaning you can have up to 16 ports passing traffic, with no stand-by ports. When you select this option, the Mode for all interfaces assigned to this EtherChannel group is switched to On (if the Mode for each is not already On). See <a href="#">Editing LACP Parameters for an Interface Assigned to an EtherChannel, page 45-11</a>, for more information about this mode.</p>                                                                                                                                                                                                                                                                                                                                                |
| Active Physical Interfaces                                                                                                                    | <p>When EtherChannel is the chosen interface Type (on the General panel), specify the minimum and maximum number of interfaces that can be active for this EtherChannel group:</p> <ul style="list-style-type: none"> <li>• <b>Minimum</b> – Specify the minimum number of interfaces that can be active for this group; enter a value from 1 to 8. Interfaces available to the channel are selected on the General tab of this dialog box (<a href="#">Add/Edit Interface Dialog Box: General Tab (PIX 7.0+/ASA/FWSM), page 45-20</a>).</li> <li>• <b>Maximum</b> – Specify the maximum number of interfaces that can be active; enter a value from 1 to 8. Interfaces available to the channel are selected on the General tab of this dialog box.</li> </ul> <p>Specifying 3, 5, 6, or 7 active ports in an EtherChannel bundle provides poor load balancing, because some ports get up to twice the load of others. We recommend specifying 2, 4, or 8 active ports per EtherChannel to achieve effective load balancing. (A value of 1 provides no load balancing at all.)</p> |
| <b>ASA Cluster (Layer 3); available on ASA 5580 and 5585 devices in cluster mode only.</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Supported by all interfaces when ASA cluster is in Router mode and supported by management interface when ASA cluster is in Transparent mode. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Supported on EtherChannel interfaces for ASA clusters. Not supported on Management interface when ASA cluster is in Transparent mode. |                                                                                                                                                                                                                                                                                                                                                                                           |
| Span EtherChannel across the ASA Cluster                                                                                              | Select to configure an EtherChannel that spans all ASAs in the cluster, and provides load balancing as part of the EtherChannel operation.                                                                                                                                                                                                                                                |
| Enable load balancing between switch pairs in VSS or vPC mode                                                                         | (Optional) If you are connecting the ASA to two switches in a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you should enable load balancing by checking the <b>Enable load balancing between switch pairs in VSS or vPC mode</b> check box. This feature ensures that the physical link connections between the ASAs to the VSS (or vPC) pair are balanced.         |
| Member Interface Configuration                                                                                                        | Identifies the LACP mode for the interface and the Virtual Switching System (VSS) or Virtual Port Channel (vPC) switch to which a given interface is connected, 1 or 2.                                                                                                                                                                                                                   |
| <b>Advanced tab options specific to ASA 5505 devices (routed mode only)</b>                                                           |                                                                                                                                                                                                                                                                                                                                                                                           |
| Block Traffic To                                                                                                                      | Restricts this VLAN interface from initiating contact with the VLAN chosen here.                                                                                                                                                                                                                                                                                                          |
| Backup Interface                                                                                                                      | Choose a VLAN interface as a backup interface, for example, to an ISP. The backup interface does not pass traffic unless the default route through the primary interface fails. To ensure that traffic can pass over the backup interface, be sure to configure default routes on both the primary and backup interfaces so that the backup interface can be used when the primary fails. |
| <b>Advanced tab options specific to FWSM 3.1+ devices</b>                                                                             |                                                                                                                                                                                                                                                                                                                                                                                           |
| Bridge Group                                                                                                                          | For an FWSM 3.1+ operating in transparent mode, this read-only field indicates the Bridge group to which this interface is assigned. See <a href="#">Add/Edit Bridge Group Dialog Box, page 45-41</a> for more information.                                                                                                                                                               |
| ASR Group                                                                                                                             | To add this interface to an asymmetric routing group, enter the ASR group number in this field. Stateful failover must be enabled for asymmetric routing support to function properly between units in failover configurations. Valid values for ASR group range from 1 to 32. See <a href="#">About Asymmetric Routing Groups, page 45-5</a> for more information.                       |

### Configuring IPv6 Interfaces (ASA/FWSM)

When Interface, Subinterface, Redundant, or EtherChannel is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **IPv6** panel are described in this section.

#### Note

These options are available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

**Navigation Path**

You can access the IPv6 panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA or FWSM Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 45-14.

**Table 45-5 IPv6 tab: Add/Edit Interface Dialog Box (ASA/FWSM)**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPv6    | Check this box to enable IPv6 and configure IPv6 addresses on this interface. You can deselect this option to disable IPv6 on the interface, but retain the configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on an interface, the source addresses of IPv6 packets received on the interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre>%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DAD Attempts        | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre data-bbox="727 835 1442 861">%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval         | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Managed Config Flag | <p>Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 45-5 IPv6 tab: Add/Edit Interface Dialog Box (ASA/FWSM) (Continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other Config Flag | Whether or not to set the flag "other-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable RA         | <p>When checked, IPv6 router advertisement transmissions are enabled on the interface. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>RA Lifetime</b> – The “router lifetime” value specifies how long nodes on the local link should consider the security appliance as the default router on the link. Valid values range from 0 to 9000 seconds; the default is 1800 seconds. Entering 0 indicates that the security appliance should not be considered a default router on the selected interface.</li> </ul> <p>Any non-zero value should not be less than the following RA Interval value.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval</b> – The interval between IPv6 router advertisement transmissions on this interface. Valid values range from 3 to 1800 seconds, (or from 500 to 1800000 milliseconds if the following RA Interval in Milliseconds option is checked); the default is 200 seconds.</li> </ul> <p>The interval between transmissions should be less than or equal to the RA Lifetime value if it is non-zero. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval in Milliseconds</b> – Checking this option indicates that the provided RA Interval value is in milliseconds, rather than seconds.</li> </ul> |

**Table 45-5 IPv6 tab: Add/Edit Interface Dialog Box (ASA/FWSM) (Continued)**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li> <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field.           <p>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</p> </li> <li> <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address.           <p>The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-45</a>.)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box, page 45-33</a>.</p> </li> </ul> |
| Interface IPv6 Prefixes  | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables, page 1-45</a>.)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box, page 45-34</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### IPv6 Address for Interface Dialog Box

This dialog box is used to add or edit an IPv6 address assigned to an ASA or FWSM interface. Multiple IPv6 addresses can be assigned to the interface in the IPv6 panel of the Add Interface or Edit Interface dialog box.

#### Note

This dialog box is available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

#### Navigation Path

You can access the IPv6 Address for Interface dialog box:

- From the IPv6 panel of the ASA or FWSM Add Interface and Edit Interface dialog boxes.

- From the Management IPv6 page of an ASA 5505 in transparent firewall mode (version 8.2 and 8.3 devices only).

Click the Add Row or Edit Row buttons beneath the table in the Interfaces IPv6 Addresses section to open the dialog box.

**Table 45-6 IPv6 Address for Interface Dialog Box**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Prefix Length | Enter an IPv6 network address to be assigned to the interface, with its Prefix Length appended, where the Prefix Length integer indicates how many of the high-order, contiguous bits of the address comprise network portion of the address. A slash (/) must precede the Prefix Length. For example, 3FFE:C00:0:1::/64.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| EUI-64                | <p>If this box is checked, the EUI-64 interface ID will be used in the low-order 64 bits of the IPv6 address. If the value specified for the Prefix Length is greater than 64 bits, the prefix bits have precedence over the interface ID. An error occurs if another host is using the specified address.</p> <p>The Modified EUI-64 format interface ID is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64 bit interface ID of 02E0:B6FF:FE01:3B7A.</p> |
| IPv6 Address Pool     | Enter or select the IPv6 Pool object that represents the pool of addresses to use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### IPv6 Prefix Editor Dialog Box

This dialog box is used to add or edit an IPv6 prefix (that is, the network portion of an IPv6 address), providing control over individual parameters, including whether the prefix should be included in IPv6 router advertisements. Multiple prefixes can be configured in the IPv6 panel of the ASA or FWSM Add Interface or Edit Interface dialog box.

#### Note

This dialog box is available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

By default, prefixes configured as addresses on an interface are advertised in router advertisements. If you configure specific prefixes for advertisement, then only those prefixes are advertised. The valid and preferred lifetimes are counted down in real time. Alternately, a date can be set to specify the expiration of a prefix. When the expiration is reached, the prefix is no longer advertised.

### Navigation Path

You can access the IPv6 Prefix Editor dialog box from the IPv6 panel of the Add Interface and Edit Interface dialog boxes: click the Add Row or Edit Row buttons beneath the table in the Interfaces IPv6 Prefixes section in either of those dialog boxes.

| Element               | Description                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Prefix Length | Enter an IPv6 network address, with its Prefix Length appended, where the Prefix Length integer indicates how many of the high-order, contiguous bits of the address represent the network portion of the address. A slash (/) must precede the Prefix Length. For example, 3FFE:C00:0:1::/64.                    |
| Default               | If this box is checked, the settings in this dialog box will apply to all prefixes, rather than a single address. (When checked, the Address/Prefix Length field is disabled.)                                                                                                                                    |
| No Advertisements     | When checked, hosts on the local link cannot use the specified prefix in advertisements.                                                                                                                                                                                                                          |
| Off Link              | When checked, the specified prefix is “off-link”; that is, not locally reachable on the link.<br><br>When on-link (the default), the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. |
| No Auto-Configuration | When checked, hosts on the local link cannot use the specified prefix for IPv6 autoconfiguration.<br><br>When auto-configuration is on (the default), hosts on the local link can use the specified prefix for IPv6 autoconfiguration.                                                                            |

Table 45-7 IPv6 Prefix Editor Dialog Box (Continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefix Lifetime | <p>You can expand this section of the dialog box to display the following expiration options:</p> <ul style="list-style-type: none"> <li>• <b>Lifetime Duration</b> – Select this option to define prefix expiration as a length of time; the following options are enabled: <ul style="list-style-type: none"> <li>– <b>Valid Lifetime</b> – The amount of time (in seconds) that the specified IPv6 prefix is advertised as being valid. Enter a value from 0 to 4294967295 seconds. The maximum value represents infinity (that is, the lifetime does not expire), which can also be specified by the checking the <b>Infinite</b> box. The default is 2592000 (30 days).</li> <li>– <b>Preferred Lifetime</b> – The amount of time (in seconds) that the specified IPv6 prefix is advertised as being preferred. Enter a value from 0 to 4294967295 seconds. The maximum value represents infinity (that is, the lifetime does not expire), which can also be specified by the checking the <b>Infinite</b> box. The default is 604800 (7 days). The Preferred Lifetime must less than or equal to the Valid Lifetime.</li> </ul> </li> <li>• <b>Lifetime Expiration Date</b> – Select this option to define prefix expiration as a specific date. Note that acceptable values for this date can range from today’s date to one year from today’s date. The following options are enabled: <ul style="list-style-type: none"> <li>– <b>Valid</b> – The prefix is advertised as being valid until this date and time are reached. Enter a date in the form <code>Mmm dd yyyy</code> (that is, three-letter month abbreviation, two-digit date, and four-digit year), or click the calendar icon to select a date from a scrolling calendar. Also, enter the time of expiration on the specified date, in the form <code>hh:mm</code>, based on a 24-hour clock.</li> <li>– <b>Preferred</b> – The prefix is advertised as being preferred until this date and time are reached. Enter a date in the form <code>Mmm dd yyyy</code> (that is, three-letter month abbreviation, two-digit date, and four-digit year), or click the calendar icon to select a date from a scrolling calendar. Also, enter the time of expiration on the specified date, in the form <code>hh:mm</code>, based on a 24-hour clock. The Preferred date and time must be earlier than or equal to the Valid date and time.</li> </ul> </li> </ul> |

### Device Interface: IP Type (PIX/ASA 7.0+)

A security device operating in single-context, routed mode requires IP addressing for its interfaces; however, firewall interfaces do not have IP addresses until you assign them. Note that in transparent mode, the device acts as an access-control bridge (a “bump in the wire”)—you assign different VLANs to each interface, but IP addressing is not necessary.

The Add/Edit Interface dialog box presented for an independent ASA or PIX 7.0+ device in single-context, routed mode includes the section **IP Type**, where you specify the type of IP addressing for the interface and provide related parameters, as described here. (The IP Type section of the Add/Edit Interface dialog box for PIX 6.3 devices is described in [Device Interface: IP Type \(PIX 6.3\)](#), page 45-18.)

In multiple-context mode, interface IP addresses are set in the context configuration.

**Note**

Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

Also, do not specify IP Type information for an interface you intend to use as a redundant interface.

**Step 1**

In the Add/Edit Interface dialog box, choose a method for address assignment (**Static IP**, **Use DHCP**, or **PPPoE (PIX and ASA 7.2+)**) from the **IP Type** list, and then provide related parameters, as follows:

- **Static IP** – Provide a static **IP Address** and **Subnet Mask** that represents the security device on this interface's connected network. The IP address must be unique for each interface.

The Subnet mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24). Do not use 255.255.255.254 or 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface. If you omit the Subnet Mask value, a “classful” network is assumed, as follows:

- The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (i.e., addresses 1.0.0.0 through 126.255.255.255).
- The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (i.e., addresses 128.0.0.0 through 191.255.255.255).
- The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (i.e., addresses 192.0.0.0 through 223.255.255.255).

**Note**

Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

- **Use DHCP** – Enables Dynamic Host Configuration Protocol (DHCP) for automatic assignment of an IP address from a DHCP server on the connected network. The following options become available:
  - **DHCP Learned Route Metric** (required) – Assign an administrative distance to the learned route. Valid values are 1 to 255. The administrative distance for learned routes defaults to 1.  
All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.
  - **Obtain Default Route using DHCP** – Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route. See also [Configuring Static Routes, page 54-48](#).
  - **Enable Tracking for DHCP Learned Route** – If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking via a specific Service Level Agreement (SLA) monitor. The following option becomes available:
    - **Tracked SLA Monitor** – Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 50-7](#) for more information.
- **PPPoE (PIX and ASA 7.2+)** – Enables Point-to-Point Protocol over Ethernet (PPPoE) for automatic assignment of an IP address from a PPPoE server on the connected network; this option is not supported with failover. The following options become available:

- **VPDN Group Name** (required) – Choose the Virtual Private Dialup Network (VPDN) group that contains the authentication method and user name/password to use for network connection, negotiation and authentication. See [Managing VPDN Groups, page 45-45](#) for more information.
- **IP Address** – If provided, this static IP address is used for connection and authentication, instead of a negotiated address.
- **Subnet Mask** – The subnet mask to be used in conjunction with the provided IP Address.
- **PPPoE Learned Route Metric** (required) – Assign an administrative distance to the learned route. Valid values are 1 to 255; defaults to 1.  
All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.
- **Obtain Default Route using PPPoE** – Select this option to obtain a default route from the PPPoE server; sets the default routes when the PPPoE client has not yet established a connection. When using this option, you cannot have a statically defined route in the configuration.
- **Enable Tracking for PPPoE Learned Route** – If Obtain Default Route using PPPoE is selected, you can select this option to enable route tracking for PPPoE-learned routes. The following options become available:
  - **Dual ISP Interface** – If you are defining interfaces for dual ISP support, choose Primary or Secondary to indicate which connection you are configuring.
  - **Tracked SLA Monitor** – Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 50-7](#) for more information.

---

**Note** You can configure DHCP and PPPoE only on the outside interface of a firewall device. If you have already configured PPPoE on the outside interface, it is no longer available as an option.

---

**Step 2** Continue configuring the device interface in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19.

---

## Device Interface: MAC Address

By default, a physical interface uses its “burned-in” MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then its MAC address changes to match the MAC address of the interface that is now listed first. If you manually assign a MAC address to the redundant interface, that is used regardless of the physical-interface MAC addresses.

Similarly, all interfaces assigned to an EtherChannel group share the same MAC address. By default, the EtherChannel uses the MAC address of the lowest-numbered member interface. However, you can manually configure a MAC address for the EtherChannel to prevent traffic disruption should the low-numbered interface be removed from the group.

You also might want to assign unique MAC addresses to subinterfaces. For example, your service provider might control access based on MAC addresses.

Further, if you use failover, you can provide a standby MAC address. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

**Note**

The following options appear only on the Advanced tab of the Add Interface and Edit Interface dialog boxes presented by PIX 7.2+ and ASA 7.2+ devices.

(Optional) To manually assign a private MAC address to the current interface:

**Step 1**

In the Add/Edit Interface dialog box, provide the desired MAC address in the **Active MAC Address** field.

MAC addresses are provided in *H.H.H* format, where *H* is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE.

**Note**

In some cases, you may have to press the Tab key after entering the Active MAC Address to activate the Standby MAC Address field.

**Step 2**

If desired, provide a **Standby MAC Address** for use with device-level failover.

If the active unit fails over and the standby unit becomes active, the new active unit begins using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

**Step 3**

Continue configuring the device interface in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19.

## Configuring Hardware Ports on an ASA 5505

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: *Hardware Ports* and *Interfaces*. The table on the Hardware Ports panel displays currently configured switch ports for the selected ASA 5505.

Use the Configure Hardware Ports dialog box to configure the switch ports on an ASA 5505, including setting the mode, assigning a switch port to a VLAN, and setting the Protected option. (The following dialog-box parameter descriptions also describe the fields in the Hardware Ports table.)

**Caution**

The ASA 5505 does not support Spanning Tree Protocol for loop detection in the network. Therefore, you must ensure that any connection with the appliance does not end up in a network loop.

**Navigation Path**

You can access the Configure Hardware Ports dialog box by clicking Add Row or Edit Row on the Hardware Ports panel of the ASA 5505 Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), page 45-14 for more information.

| Enable Interface | Select this option to enable this switch port. You can deselect this option to disable the port, but retain its configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Isolated         | Select this option to prevent this port from communicating with other isolated or “protected” switch ports on the same VLAN.<br><br>You might want to prevent switch ports from communicating with each other if the devices on those ports are primarily accessed from other VLANs, if you do not need to allow intra-VLAN access, and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three Web servers, you can isolate the Web servers from each other if you apply the Isolated option to each switch port. The inside and outside networks can both communicate with all three Web servers, and vice versa, but the Web servers cannot communicate with each other. |
| Hardware Port    | Choose the switch port that you are configuring; all device ports are listed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Mode             | Choose a mode for this port: <ul style="list-style-type: none"> <li>• <b>Access Port</b> – Sets the port to access mode. Each access port can be assigned to one VLAN.</li> <li>• <b>Trunk Port</b> – Sets the port to trunk mode using 802.1Q tagging. Trunk ports can carry multiple VLANs using 802.1Q tagging.</li> </ul> Trunk mode is available only with the Security Plus license. Trunk ports do not support untagged packets, there is no native VLAN support, and the appliance drops all packets that do not contain a tag.                                                                                                                                                                                                                            |
| VLAN ID          | Enter VLAN ID(s) for this port, according to the chosen Mode: <ul style="list-style-type: none"> <li>• For Access Port mode, enter the ID of the VLAN to which this switch port is to be assigned.</li> <li>• For Trunk Port mode, you can enter multiple VLAN IDs, and multiple ID ranges (such as 4-8), separated by commas.</li> </ul> <p><b>Note</b> For devices running operating system 7.2(2)18 or earlier, valid VLAN IDs are 1 to 1001; with version 7.2(2)19 or later, valid IDs are 1 to 4090.</p>                                                                                                                                                                                                                                                      |
| Duplex           | Choose a duplex option for the port: <b>Full</b> , <b>Half</b> , or <b>Auto</b> . The Auto setting is recommended, and the default.<br><br>If you set Duplex to anything other than Auto for PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 45-8** *Configure Hardware Ports Dialog Box (Continued)*

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed   | <p>Choose a speed for the port: <b>10</b>, <b>100</b>, or <b>Auto</b>. The Auto setting is recommended, and the default.</p> <p>If you set Speed to anything other than Auto for PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.</p> <p>The default Auto setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either Speed or Duplex must be set to Auto to enable Auto-MDI/MDIX for the interface. If you explicitly set both Speed and Duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled.</p> |

## Add/Edit Bridge Group Dialog Box

A transparent firewall connects the same network on its inside and outside interfaces, and supports only the two interfaces per context. However, you can increase the number of interfaces available to a context through use of bridge groups. You can configure up to eight bridge groups; on an FWSM each group can contain two interfaces; on an ASA each group can contain four interfaces.

Each bridge group connects to a separate network. Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the security appliance—traffic must exit the security appliance to be routed by an external router back to another bridge group in the security appliance.

You might want to use more than one bridge group if you do not want the overhead of security contexts, or want to maximize your use of security contexts. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration. For complete security policy separation, use security contexts with one bridge group in each context.

For FWSM 3.1+ and ASA 8.4.1+ devices in transparent mode, the Interfaces page displays two tabbed panels: Interfaces and Bridge Groups. The following information applies to the Bridge Groups panel and the Add/Edit Bridge Group dialog box; refer to [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FWSM\)](#), page 45-19 for information about the Interfaces panel.

### Navigation Path

You can access the Add/Edit Bridge Group dialog box from the Bridge Groups panel of the Interfaces page.

## Field Reference

Table 45-9 Add/Edit Bridge Group Dialog Box

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                       | Enter a name for this bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ID                         | Enter an identifier for this bridge group; can be an integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interface A                | Choose the first interface or VLAN to assign to this bridge group; all interfaces defined on the Interfaces panel are listed.                                                                                                                                                                                                                                                                                                                                                                        |
| Interface B                | Choose the second interface or VLAN to assign to this bridge group; all interfaces defined on the Interfaces panel are listed.                                                                                                                                                                                                                                                                                                                                                                       |
| Interface C<br>Interface D | Choose the third and fourth interfaces or VLANs to assign to this bridge group; all interfaces defined on the Interfaces panel are listed.<br><b>Note</b> These two options are available only on ASA 8.4.1 and later devices operating in transparent mode.                                                                                                                                                                                                                                         |
| IP Address                 | Enter or Select a management IP address for the bridge group. A transparent firewall does not participate in IP routing. Thus, the only IP configuration required for a bridge group is this management IP address. This address is the source address for traffic originating on the security appliance, such as system messages or communications with AAA servers. You can also use this address for remote management access.<br><b>Note</b> IPv6 addresses are not supported for bridge groups. |
| Netmask                    | Network mask for the specified IP address. You can express the value in dotted decimal format (for example, 255.255.255.0) or by entering the number of bits in the network mask (for example, 24).<br><b>Note</b> Do not use 255.255.255.254 or 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface.                                                                                                                                         |
| Description                | You can enter an optional description for this bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Advanced Interface Settings (PIX/ASA/FWSM)

Advanced configuration options are available for interfaces on FWSMs and ASA/PIX 7.0+ devices operating in single-context mode and for ASA 9.0+ devices operating in single-context mode or multi-context mode.

These are general device-related settings; that is, they are not applied to individual interfaces.

**Note**

The information in this section does not apply to PIX 6.3 devices, nor to security devices in multiple-context mode.

The Advanced Interface Settings dialog box includes the following elements:

- **MAC Address Auto** - Enable this option to automatically assign private MAC addresses to each shared context interface. You can also, optionally, set a user-defined prefix as part of the MAC address. The prefix is a decimal value between 0 and 65535. If you do not enter a prefix, then the

ASA generates a default prefix. This prefix is converted to a 4-digit hexadecimal number. The prefix ensures that each ASA uses unique MAC addresses (using different prefix values), so you can have multiple ASAs on a network segment, for example.

- **Traffic between interfaces with same security levels** – This parameter controls communication between interfaces and subinterfaces on the same security level. If you enable same security interface communication, you can still configure interfaces at different security levels as usual. Refer to [Enabling Traffic between Interfaces with the Same Security Level, page 45-43](#) for more information.
- **PPPoE Users button** – Click this button to open the PPPoE Users dialog box, where you can add, edit and delete PPPoE users, as described in [Managing the PPPoE Users List, page 45-44](#). This option is available only for ASA and PIX 7.0+ devices.
- **VPDN Groups (PIX and ASA 7.2+)** – This table lists currently defined VPDN Groups. The buttons below the table are used to add, edit and delete VPDN group entries, as described in [Managing VPDN Groups, page 45-45](#).
- **LACP System Priority (ASA 8.4.1+)** – All systems participating in EtherChannel link aggregation require a Link Aggregation Control Protocol (LACP) System Priority. The value can be 1 to 65535, with the higher number signifying lower priority. The default is 32768.

This value is combined with the system MAC address to form the system's LACP identifier, and thus is applicable only for EtherChannel interfaces. See [Configuring EtherChannels, page 45-8](#), for more information.

**Note**

Additional LACP parameters are available in the Edit Interface dialog box for individual interfaces assigned to an EtherChannel; see [Editing LACP Parameters for an Interface Assigned to an EtherChannel, page 45-11](#), for more information.

**Navigation Path**

You can open the Advanced Interface Settings dialog box by clicking the Advanced button at the bottom of the Interfaces page (for non-5505 ASAs, PIX 7.0+ devices, and FWSMs), or at the bottom of the Interfaces tab on the ASA 5505 Ports and Interfaces page.

**Related Topics**

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#)

## Enabling Traffic between Interfaces with the Same Security Level

The [Advanced Interface Settings \(PIX/ASA/FWSM\), page 45-42](#) dialog box presented for a single-context security device includes the “Traffic between interfaces with the same security level” drop-down list, as described in this section.

By default, interfaces or subinterfaces on the same security level cannot communicate with each other. Allowing communication between same-security interfaces provides the following benefits:

- You can configure more than 101 communicating interfaces.  
If you use different levels for each interface and do not assign any interfaces to the same security level, you can configure only one interface per level (0 to 100).
- You can allow traffic to flow freely between all same-security interfaces without access lists.

**Note**

If you enable NAT control, you do not need to configure NAT between same-security-level interfaces.

- Step 1** In the Advanced Interface Settings dialog box, choose the option that identifies how you want this device to handle **Traffic between interfaces with the same security levels**:
- **Disabled**—Communication between interfaces on the same security level is not allowed.
  - **Inter-interface**—Enables traffic flows between interfaces with the same security level setting. When this option is enabled, you are not required to define translation rules to enable traffic flow between interfaces in the firewall device.
  - **Intra-interface**—Enables traffic flows between subinterfaces with the same security level setting. When this option is enabled, you are not required to define translation rules to enable traffic flow between subinterfaces assigned to an interface.
  - **Both**—Allows both intra- and inter-interface communications among interfaces and subinterfaces with the same security level.
- Step 2** Continue with [Advanced Interface Settings \(PIX/ASA/FWSM\), page 45-42](#) configuration, or click OK to close the Advanced Interface Settings dialog box.

## Managing the PPPoE Users List

Point-to-Point Protocol over Ethernet (PPPoE) allows standard PPP communication between a security device and an external ISP, via an Ethernet interface on the device. To establish a communication link, the device must provide authentication credentials and obtain network parameters. This is accomplished using a Virtual Private Dialup Network (VPDN) group, which basically consists of established PPPoE user credentials (i.e., a user name and password) and an authentication protocol. See [Managing VPDN Groups, page 45-45](#) for more information about VPDN groups.

The PPPoE user credentials available for use with VPDN groups are maintained in the PPPoE Users dialog box, which you can access from the [Advanced Interface Settings \(PIX/ASA/FWSM\), page 45-42](#) dialog box, and from the Add/Edit VPDN Group dialog boxes.

### Adding and Editing PPPoE Users

The PPPoE Users dialog box presents a table of currently defined PPPoE users, along with standard Add Row, Edit Row, and Delete Row buttons. The Add Row button opens the Add PPPoE User dialog box; the Edit Row button opens the virtually identical Edit PPPoE User dialog box.

Enter or edit the following PPPoE user parameters, and then click OK to close the Add (Edit) PPPoE User dialog box and return to the Advanced Interface Settings dialog box.

#### Note

PPPoE user options are not available on Firewall Service Modules (FWSMs).

| Confirm                                    | Re-enter the password.                                                                                                                      |
| Store Username and Password in Local Flash | If checked, this PPPoE user information will be stored in the device's local flash memory, ensuring it cannot be inadvertently overwritten. |

## Managing VPDN Groups

A Virtual Private Dialup Network (VPDN) group—basically an established PPPoE user and an authentication protocol—is used by a security device to contact an external ISP and authenticate itself, in order to establish a PPPoE communications link and obtain network parameters. (See [Managing the PPPoE Users List, page 45-44](#) for information about establishing PPPoE users.)

Available VPDN groups are maintained in the Advanced Interface Settings dialog box, which opens when you click the Advanced button at the bottom of the Interfaces page, as described in [Advanced Interface Settings \(PIX/ASA/FWSM\), page 45-42](#).

### Adding and Editing VPDN Groups

The Advanced Interface Settings dialog box includes a table of currently defined VPDN groups, and standard Add Row, Edit Row, and Delete Row buttons. The Add Row button opens the Add VPDN Group dialog box; the Edit Row button opens the virtually identical Edit VPDN Group dialog box.

Enter or edit the following VPDN group parameters, and then click OK to close the Add (Edit) VPDN Group dialog box and return to the Advanced Interface Settings dialog box.

#### Note

VPDN group options are not available on Firewall Service Modules (FWSMs).

### About Bridging on Firewall Devices

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 device that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. The security appliance connects the same network on its inside and outside ports, acting as an access-control bridge; you assign different VLANs to each interface, and IP addressing is not used.

Thus, you can easily introduce a transparent firewall into an existing network—IP re-addressing is unnecessary—and maintenance is facilitated because there are no complicated routing patterns to troubleshoot and no NAT configuration.

Although the transparent-mode device acts as a bridge, Layer 3 traffic, such as IP traffic, cannot pass through the security appliance unless you explicitly permit it with specific access rules. The only traffic allowed through a firewall without an access list is ARP traffic, which you can control using ARP inspection, and IPv6 neighbor discovery.

When the security appliance runs in transparent mode, the outgoing interface of a packet is determined by performing a MAC address lookup instead of a route lookup. Route statements can still be configured, but they apply only to security appliance-originated traffic. For example, if your syslog server is located on a remote network, you must use a static route so the security appliance can reach that subnet.

To configure a transparent firewall, use the following policies. When configuring an ASA/PIX/FWSM device in multiple-context mode, configure these policies on each transparent security context.

- **Firewall > Access Rules**—Access rules control layer 3 and higher traffic using extended access control lists. In routed mode, some types of traffic cannot pass through the security appliance even if you allow it in an access list. For example, you can establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on access rules. Likewise, protocols like HSRP or VRRP can pass through the security appliance. However, the transparent-mode security appliance does not pass CDP packets.

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can provide those functions. For example, by using access rules, you can allow DHCP traffic to pass (instead of the unsupported DHCP relay feature), or multicast traffic such as that created by IP/TV.

For more information, see [Understanding Access Rules, page 16-1](#) and [Configuring Access Rules, page 16-7](#).

- **Firewall > Transparent Rules**—Transparent rules control non-IP layer 2 traffic using Ethertype access control lists. For example, you can configure rules to allow AppleTalk, IPX, BPDUs, and MPLS to pass through the device. For more information, see [Configuring Transparent Firewall Rules, page 22-1](#).
- **Platform > Bridging > ARP Table, ARP Inspection and IPv6 Neighbor Cache**—Use these policies to control the types of ARP and IPv6 traffic allowed through the bridge. If desired, you can configure static ARP and IPv6 neighbor cache entries and drop any traffic not defined by those static rules. Enable ARP inspection so that if a mismatch between the MAC address, the IP address, or the interface occurs, the security appliance drops the packet. This helps prevent ARP spoofing. For more information, see [ARP Table Page, page 46-3](#) and [ARP Inspection Page, page 46-5](#).

---

**Note** The ARP Table and IPv6 Neighbor Cache are the only bridging policies available for non-transparent ASA/PIX/FWSM devices.

---

- **Platform > Bridging > MAC Address Table and MAC Learning**—Use these policies to configure static MAC-IP address mappings and to enable or disable MAC learning. MAC learning is enabled by default, which allows the appliance to add MAC-IP address mappings as traffic passes through the interface. If you want to prevent all traffic except from static entries, you can disable MAC learning. For more information, see [MAC Address Table Page, page 46-7](#) and [MAC Learning Page, page 46-8](#).
- **Platform > Bridging > Management IP and Platform > Bridging > Management IPv6**—Use these policies to configure a management IP address that Security Manager can use to communicate with the device.

---

**Note** The Management IP and Management IPv6 pages are not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

If you change the management IP address, you also need to update the device properties for the device or security context. Follow these steps:

- Change the management IP address, save and submit your changes.
- Deploy your changes to the device.

- In Device view, select the device or security context, then select **Tools > Device Properties**. On the General page, enter the new management IP address in the IP Address field. On the Credentials tab, update the username and password fields with account credentials that can log into the management interface. Security Manager will now use this address and user account for subsequent deployments and device communication.

For more information, see [Management IP Page, page 46-10](#).

## Bridging Support for FWSM 3.1

Although FWSM 3.1 can support multiple L2 interface pairs, Security Manager lets you specify no more than two L2 interfaces (a single interface pair), and one associated management IP address. That means only one bridge group with two named interfaces associated is provisioned with a management IP address. If the device configuration contains a maximum of one bridge group and two named interfaces, it is valid for discovery. All other scenarios result in an error message and the commands are ignored during discovery. Furthermore, discovery will not show any bridge-group information in Security Manager, although the bridge-group commands will be generated during deployment. Bridge group 1 will be deployed and used in transparent rule policies if no bridge group exists in the device configuration.

## ARP Table Page

Use the ARP Table page to add static ARP entries that map a MAC address to an IP address and identifies the interface through which the host is reached.

#### Navigation Path

- (Device view) Select **Platform > Bridging > ARP Table** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > ARP Table** from the Policy Type selector. Right-click **ARP Table** to create a policy, or select an existing policy from the Shared Policy selector.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout (seconds) | <p>The amount of time, between 60 and 4294967 seconds, before the security appliance rebuilds the ARP table. The default is 14400 seconds.</p> <p>Rebuilding the ARP table automatically updates new host information and removes old host information. You might want to reduce the timeout because the host information changes frequently.</p> <p><b>Note</b> The timeout applies to the <i>dynamic</i> ARP table, and not the static entries contained in the ARP table.</p>                                                                                                                                                                                             |
| <b>ARP Table</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Interface         | The interface to which the host is attached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IP Address        | The IP address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MAC Address       | The MAC address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Alias Enabled     | <p>Indicates whether the security appliance performs proxy ARP for this mapping. If this setting is enabled and the security appliance receives an ARP request for the specified IP address, it responds with the security appliance MAC address. When the security appliance receives traffic destined for the host belonging to the IP address, the security appliance forwards the traffic to the host MAC address that you specify in this command. This feature is useful if you have devices that do not perform ARP, for example.</p> <p><b>Note</b> In transparent firewall mode, this setting is ignored and the security appliance does not perform proxy ARP.</p> |

## Add/Edit ARP Configuration Dialog Box

Use the Add/Edit ARP Configuration dialog box to add a static ARP entry that maps a MAC address to an IP address and identifies the interface through which the host is reached.

**Navigation Path**

You can access the Add/Edit ARP Configuration dialog box from the ARP Table page. For more information about the ARP Table page, see [ARP Table Page, page 46-3](#).

**Related Topics**

- [About Bridging on Firewall Devices, page 46-1](#)

|-----------|------------------------------------------------------------------|
| Interface | The name of the interface to which the host network is attached. |

**Table 46-2** Add/Edit ARP Configuration dialog box (Continued)

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address   | The IP address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MAC Address  | The MAC address of the host; for example, 00e0.1e4e.3d8b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Alias | When selected, enables proxy ARP for this mapping. If the security appliance receives an ARP request for the specified IP address, it responds with the security appliance MAC address. When the security appliance receives traffic destined for the host belonging to the IP address, the security appliance forwards the traffic to the host MAC address that you specify in this command. This feature is useful if you have devices that do not perform ARP, for example.<br><br><b>Note</b> In transparent firewall mode, this setting is ignored and the security appliance does not perform proxy ARP. |

## ARP Inspection Page

Use the ARP Inspection page to configure ARP inspection for a transparent firewall. ARP inspection is used to prevent ARP spoofing.

### Navigation Path

- (Device view) Select **Platform > Bridging > ARP Inspection** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > ARP Inspection** from the Policy Type selector. Right-click **ARP Inspection** to create a policy, or select an existing policy from the Shared Policy selector.

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                               | The name of the interface for which you are enabling or disabling ARP inspection.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable ARP Inspection on this interface | When selected, enables ARP inspection on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Flood ARP packets                       | When selected, packets that do not match any element of a static ARP entry are flooded out all interfaces except the originating interface. If there is a mismatch between the MAC address, the IP address, or the interface, the security appliance drops the packet. If you do not select this check box, all non-matching packets are dropped.<br><br><b>Note</b> The dedicated management interface, if present, never floods packets even if this parameter is set to flood. |

## Managing the IPv6 Neighbor Cache

Use the IPv6 Neighbor Cache page to manage static IPv6 neighbor entries that map a MAC address to an IPv6 address, and identify the interface through which the neighbor host is reached, to provide address-resolution functions for IPv6. This is available on ASA 7.0+ devices only.

**Note**

The IPv6 Neighbor Cache entries are the IPv6 equivalent of the static ARP entries, managed on the [ARP Table Page, page 46-3](#).

If an entry for a specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry. Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

The IPv6 Neighbor Cache page is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons. (These are standard buttons, as described in [Using Tables, page 1-45](#).) The Add Row button opens the Add IPv6 Neighbor Cache Configuration dialog box, and Edit Row opens the Edit IPv6 Neighbor Cache Configuration dialog box. Other than the titles, the two dialog boxes are identical.

**Note**

Ensure that IPv6 is enabled on at least one interface before trying to add a neighbor.

**Field Reference**

**Table 46-5** Add/Edit IPv6 Neighbor Cache Configuration dialog boxes

| Element     | Description                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface   | Enter or Select the name of the interface on which to add the neighbor.                                                                                                                                                                                                         |
| IP Address  | Enter the IPv6 address that corresponds to the local data-link address. (If an entry for the specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry.) |
| MAC Address | Enter the local data-line (hardware) MAC address of the host; for example, 00e0.1e4e.3d8b.                                                                                                                                                                                      |

## MAC Address Table Page

Use the MAC Address Table page to add static MAC address entries to the MAC Address table. The table associates the MAC address with the source interface so that the security appliance knows to send any packets addressed to the device out the correct interface.

**Navigation Path**

- (Device view) Select **Platform > Bridging > MAC Address Table** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > MAC Address Table** from the Policy Type selector. Right-click **MAC Address Table** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

**Table 46-7**      *Add/Edit MAC Table Entry dialog box*

| Element     | Description                                           |
|-------------|-------------------------------------------------------|
| Interface   | The interface to which the MAC address is associated. |
| MAC Address | The MAC address; for example, 00e0.1e4e.3d8b.         |

## MAC Learning Page

Use the MAC Learning page to enable or disable MAC address learning on an interface. By default, each interface learns the MAC addresses of entering traffic, and the security appliance adds corresponding entries to the MAC address table. You can disable MAC address learning if desired; however, unless you statically add MAC addresses to the table, no traffic can pass through the security appliance.

### Navigation Path

- (Device view) Select **Platform > Bridging > MAC Learning** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > MAC Learning** from the Policy Type selector. Right-click **MAC Learning** to create a policy, or select an existing policy from the Shared Policy selector.

#### Field Reference

**Table 46-9** *Add/Edit MAC Learning dialog box*

| Element              | Description                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------|
| Interface            | The interface to which the MAC learning setting applies.                                        |
| MAC Learning Enabled | When selected, the security appliance learns MAC addresses from traffic entering the interface. |

## Management IP Page

A transparent firewall does not participate in IP routing. The only IP configuration required for the device is specification of a management IP address, which is used as the source address for traffic originating on the device, such as system messages or communications with AAA servers. You can also use this address for remote-management access.

For IPv4 traffic, the management IP address is required to pass any traffic.

### Note

In addition to the management IP address for the device, you can configure an IP address for the Management 0/0 or 0/1 management-only interface. This IP address can be on a separate subnet from the main management IP address.

Use the Management IP page to set the management IP address for a security device, or for a context in transparent firewall mode.

### Navigation Path

- (Device view) Select **Platform > Bridging > Management IP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > Management IP** from the Policy Type selector. Right-click **Management IP** to create a policy, or select an existing policy from the Shared Policy selector.

| Element               | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| Management IP Address | The management IP address.                                     |
| Subnet Mask           | The subnet mask that corresponds to the management IP address. |

## Management IPv6 Page (ASA 5505)

A transparent firewall does not participate in IP routing. The only IP configuration required for the device is specification of a management IP address, which is used as the source address for traffic originating on the device, such as system messages or communications with AAA servers. You can also use this address for remote-management access.

For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations. If you configure the global address, a link-local address is automatically configured on each interface, so you do not also need to specifically configure a link-local address.

However, if you do not configure a global management address, you need to configure interface link-local addresses, as described in [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), page 45-29. Note that you can configure both IPv6 and IPv4 management addresses on a device.

On an ASA 5505 in transparent mode, use the Management IPv6 page to enable IPv6, configure neighbor solicitation, and manage IPv6 interface addresses.

**Note**

---

This page is available only on ASA 5505 version 8.2 and 8.3 devices in transparent mode.

---

**Navigation Path**

- (Device view) Select **Platform > Bridging > Management IPv6** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > Management IPv6** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DAD Attempts   | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre data-bbox="688 835 1403 863">%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval    | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Reachable Time | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## CHAPTER 47

# Configuring Device Administration Policies on Firewall Devices

---

The Device Admin section contains pages for configuring device administration policies for firewall devices.

This chapter contains the following topics:

- [About AAA on Security Devices, page 47-1](#)
- [Configuring Banners, page 47-8](#)
- [Configuring Boot Image/Configuration Settings, page 47-9](#)
- [Setting the Device Clock, page 47-11](#)
- [Configuring Device Credentials, page 47-13](#)

## About AAA on Security Devices

Authentication-Authorization-Accounting (AAA) enables the security appliance to determine who a user is (authentication), what the user can do (authorization), and what the user did (accounting). You can use authentication alone, or with authorization and accounting. Authorization always requires a user to be authenticated first. You also can use accounting alone, or with authentication and authorization.

Authentication-Authorization-Accounting provides an extra level of protection and control for user access beyond access lists alone. For example, you can create an ACL that allows all outside users to access Telnet on a server on the DMZ network. If you want to limit user access to the server when you may not always know the IP addresses of these users, you can enable AAA to allow only authenticated and/or authorized users to make it through the security appliance. (The Telnet server enforces authentication, too; the security appliance prevents unauthorized users from attempting to access the server.)

- **Authentication**—Authentication grants access based on user identity. Authentication establishes user identity by requiring valid user credentials, which are typically a user name and password. You can configure the security appliance to authenticate the following items:
  - Administrative connections to the security appliance using Telnet, SSH, HTTPS/ASDM, or serial console.
  - The **enable** command.

- **Authorization**—Authorization controls user capabilities after users are authenticated. Authorization controls the services and commands available to each authenticated user. If you do not enable authorization, authentication alone would provide the same access to services for all authenticated users.

If you need the control that authorization provides, you can configure a broad authentication rule, and then have a detailed authorization configuration. For example, you might authenticate inside users who attempt to access any server on the outside network, and then use authorization to limit the outside servers that a particular user can access.

The security appliance caches the first 16 authorization requests per user, so if the user accesses the same services during the current authentication session, the security appliance does not resend the request to the authorization server.

- **Accounting**—Accounting tracks traffic that passes through the security appliance, providing a record of user activity. If you enable authentication for that traffic, you can account for traffic per user. If you do not authenticate the traffic, you can account for traffic per IP address. Accounting information includes when sessions start and stop, user name, the number of bytes that pass through the security appliance for the session, the service used, and the duration of each session.

## Preparing for AAA

AAA services depend upon the use of the Local database or at least one AAA server. You can also use the Local database as a fallback for most services provided by an AAA server. Before you implement AAA, you should configure the Local database and configure AAA server groups and servers.

Configuration of the Local database and AAA servers depends upon the AAA services you want the security appliance to support. Regardless of whether you use AAA servers, you should configure the Local database with user accounts that support administrative access, to prevent accidental lock-outs and, if so desired, to provide a fallback method when AAA servers are unreachable. For more information, see [Configuring User Accounts, page 50-6](#).

The following table provides a summary of AAA service support by each AAA server type and by the Local database. You manage the Local database by configuring user accounts on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts, page 50-6](#)). You establish AAA server groups and add individual AAA servers to the server groups using the **Platform > Device Admin > AAA** page.

**Table 47-1 Summary of AAA Support**

| AAA Service          | Database Type |        |         |     |     |          |      |                  |
|----------------------|---------------|--------|---------|-----|-----|----------|------|------------------|
|                      | Local         | RADIUS | TACACS+ | SDI | NT  | Kerberos | LDAP | HTTP Form        |
| Authentication of... |               |        |         |     |     |          |      |                  |
| VPN users            | Yes           | Yes    | Yes     | Yes | Yes | Yes      | Yes  | Yes <sup>1</sup> |
| Firewall sessions    | Yes           | Yes    | Yes     | No  | No  | No       | No   | No               |
| Administrators       | Yes           | Yes    | Yes     | No  | No  | No       | No   | No               |

| Administrators    | No               | Yes              | Yes     | No  | No | No       | No   | No        |

<sup>1</sup> HTTP Form protocol supports single sign-on authentication for WebVPN users only.

<sup>2</sup> For firewall sessions, RADIUS authorization is supported with user-specific ACLs only, which are received or specified in a RADIUS authentication response.

<sup>3</sup> Local command authorization is supported by privilege level only.

## Local Database

The security appliance maintains a Local database that you can populate with user accounts, which contain, at a minimum, a user name. Typically, you assign a password and a privilege level to each user name, although passwords are optional. You can manage Local user accounts on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts](#), page 50-6).

If you enable command authorization using the Local database, the security appliance refers to the assigned user privilege level to determine what commands are available. By default, all commands are assigned either privilege level 0 or level 15.

### Note

If you add users to the Local database with access to the CLI and whom you do not want to enter privileged mode, you should enable command authorization. Without command authorization, users can access privileged mode (and all commands) at the CLI using their own password if their privilege level is 2 or greater (2 is the default). Alternatively, you can use RADIUS or TACACS+ authentication for console access so the user will not be able to use the login command, or you can set all local users to level 1 so you can control who can use the system enable password to access privileged mode.

You cannot use the local database for network access authorization.

The user accounts in the Local database can provide fallback support for console and enable-password authentication, for command authorization, and for VPN authentication and authorization. This behavior is designed to help you prevent accidental lock-out from the security appliance.

For users who need fallback support, we recommend that their user names and passwords in the Local database match their user names and passwords on the AAA servers. This provides transparent fallback support. Because the user cannot determine whether a AAA server or the local database is providing the service, using user names and passwords on AAA servers that are different than the user names and passwords in the Local database means that the user cannot be certain which user name and password should be given.

For multiple-context mode, you can configure user names in the system execution space to provide individual logins at the CLI using the **login** command; however, you cannot configure any **aaa** commands that use the local database in the system execution space.

**Note**

---

VPN functions are not supported in multiple mode.

---

## AAA for Device Administration

You can authenticate all administrative connections to the security appliance, including:

- Telnet
- SSH
- Serial console
- ASDM
- VPN management access

You can also authenticate administrators who attempt to enter enable mode. You can authorize administrative commands. You can have accounting data for administrative sessions and for commands issued during a session sent to an accounting server.

You can configure AAA for device administration using the **Platform > Device Admin > AAA** page (see [About AAA on Security Devices, page 47-1](#)).

## AAA for Network Access

You can configure rules for authenticating, authorizing, and accounting for traffic passing through the firewall by using the **Firewall > AAA Rules** page (see [Chapter 15, “Managing Firewall AAA Rules”](#)). The rules you create are similar to access rules, except that they specify whether to authenticate, authorize, or perform accounting for the traffic defined; and which AAA server group the security appliance is to use to process the AAA service request.

## AAA for VPN Access

AAA services for VPN access include the following:

- User account settings for assigning users to VPN groups, configured on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts, page 50-6](#)).
- VPN group policies that can be referenced by many user accounts or tunnel groups, configured on the **Remote Access VPN > RA VPN Policies > User Group Policy** or **Site to Site VPN > User Group Policy** page.
- Tunnel group policies, configured on the **Remote Access VPN > RA VPN Policies > PIX7.0/ASA Tunnel Group Policy** or **Site to Site VPN > PIX7.0/ASA Tunnel Group Policy** page.

## Configuring AAA - Authentication Tab

The AAA page presents three tabbed panels; the **Authentication** panel is presented when you navigate to the AAA page. Use these options to control privileged access to the device console, to restrict access by connection type, and to define access messages.

Use the [Authorization Tab, page 47-6](#) to control the services and commands available to authenticated users.

Use the [Accounting Tab, page 47-7](#) to activate tracking of console traffic, providing a record of user activity.

### Navigation Path

- (Device view) Select **Platform > Device Admin > AAA** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > AAA** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Using the Authentication Tab

Use the Authentication tab to enable authentication for administrator access to the security appliance. The Authentication tab also lets you configure the prompts and messages a user sees when authenticated by an AAA server.

The device will prompt for a user name and password before you can enter commands. If the authentication server is offline, wait until the console login request times out. You can then access the console with the firewall username and the enable password.

## Authorization Tab

The Authorization tab allows you to configure authorization for accessing firewall commands.

### Navigation Path

You can access the Authorization tab from the AAA page; see [Configuring AAA - Authentication Tab, page 47-5](#).

**Related Topics**

**Field Reference****Table 47-3 Authorization Tab**

| Element                                 | Description                                                     |
|-----------------------------------------|-----------------------------------------------------------------|
| Enable Authorization for Command Access | Requires authorization for accessing firewall commands.         |
| Server Group                            | Specify the server group to use for authorization.              |
| Use LOCAL when server group fails       | Uses the LOCAL server group if the selected server group fails. |

**Accounting Tab**

Use the Accounting tab to enable accounting for access to the firewall device and for access to commands on the device.

**Navigation Path**

You can access the Accounting tab from the AAA page; see [Configuring AAA - Authentication Tab, page 47-5](#).

| Privilege Level                                                      | Minimum privilege level that must be associated with a command for an accounting record to be generated. The default privilege level is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring Banners

You can use the Banner page to specify Session (exec), Login, and Message-of-the-Day (motd) banners for a security appliance or shared policy.

### Note

If you use the token `$(hostname)` or `$(domain)` in a banner, it is replaced with the host name or domain name of the security appliance. When you enter the `$(system)` token in a context configuration, the context uses the banner configured in the system configuration.

Spaces in banner text are preserved; however, tabs cannot be entered. Multiple lines in a banner are created by entering a separate line of text for each line you wish to add. Each line is then appended to the end of the existing banner. If the line is empty, a carriage return (CR) is added to the banner.

There is no limit on the length of a banner other than RAM and flash-memory limits. You can only use ASCII characters, including new-line (press the Enter key), which counts as two characters. When accessing the security appliance through Telnet or SSH, the session closes if there is not enough system memory available to process the banner messages, or if a TCP write error occurs when attempting to display the banner messages.

#### Related Topics

- [Chapter 51, “Configuring Server Access Settings on Firewall Devices”](#)

- 
- Step 1** To configure banners, access the Banner page:
- (Device view) Select **Platform > Device Admin > Banner** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Banner** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.
- Step 2** In the **Session (exec) Banner** field, enter the text you want the system to display as a banner before displaying the enable prompt.
- Step 3** In the **Login Banner** field, enter the text you want the system to display as a banner before the password login prompt when accessing the security appliance using Telnet.
- Step 4** In the **Message-of-the-Day (motd) Banner** field, enter the text you want the system to display as a message-of-the-day banner.
- Step 5** To replace a banner, change the contents of the appropriate box.
- Step 6** To remove a banner, clear the contents of the appropriate box.
- 

## Configuring Boot Image/Configuration Settings

Use the Boot Image/Configuration page to specify which configuration file the security appliance will use at start-up. You can also specify the path to an Adaptive Security Device Manager (ASDM) configuration file.

If you do not specify a boot-image location, the first valid image on internal flash memory will be chosen to launch the system.

#### Note

This page is available only on ASA and PIX 7.0+ devices

---

#### Navigation Path

- (Device view) Select **Platform > Device Admin > Boot Image/Configuration** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Boot Image/Configuration** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

Table 47-5 Boot Image/Configuration Page

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Boot Config Location | <p>Enter the path to and name of the configuration file to be used when the system is loaded. On an ASA, you can use any of the following syntactical constructs:</p> <ul style="list-style-type: none"> <li>• <b>disk0:</b><i>[/path/]filename</i><br/>The value “disk0” represents the internal flash card. You can also use “flash” instead of “disk0,” as they are aliased: <ul style="list-style-type: none"> <li>– <b>flash:</b><i>[/path/]filename</i></li> </ul> </li> <li>• <b>disk1:</b><i>[/path/]filename</i><br/>The value “disk1” represents the external flash card.</li> </ul> <p>On a PIX device, you can use only the “flash” syntax; that is:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b><i>[/path/]filename</i></li> </ul>                                                                                                                                        |
| ASDM Image Location  | <p>The location and name of the ASDM software image to be used when ASDM sessions are initiated. (You can use ASDM to monitor both ASA and PIX devices.)</p> <p>On a PIX device, as with the Boot Config Location, you are restricted to only the “flash” syntax.</p> <p>On an ASA, as with the Boot Config Location, you can use the “disk0,” “flash,” or “disk1” constructs. In addition, you can specify an image file on a TFTP server, as follows</p> <ul style="list-style-type: none"> <li>• <b>tftp:</b><i>[/user[:password]@]server[:port]/[/path/]filename</i></li> </ul>                                                                                                                                                                                                                                                                                                                  |
| Boot Images Table    | <p>This table lists any alternate configuration files you have defined; you can specify up to four. The first available image in this list is used if you did not specify a primary file in the Boot Config Location field, or if that file is unavailable.</p> <p>This is a standard Security Manager table; use the up-arrow, down-arrow, Add Row, Edit Row, and Delete Row buttons below the table to manage these entries, as described in <a href="#">Using Tables, page 1-45</a>.</p> <p>The Add Row and Edit Row open the <a href="#">Images Dialog Box, page 47-10</a>, used to add and edit the paths to alternate configuration files.</p> <p><b>Note</b> On an ASA, the first (and only the first) entry in this table can refer to an ASDM configuration file on a TFTP server. If the device cannot reach the TFTP server, it will attempt to load the next image file in the list.</p> |

## Images Dialog Box

Use the Images dialog box to add or edit a configuration file entry in the Boot Images table on the Boot Image/Configuration page.

**Navigation Path**

You can access the Images dialog box from the Boot Image/Configuration page. For more information, see [Configuring Boot Image/Configuration Settings, page 47-9](#).

**Field Reference**

The Images dialog box contains one field, used to define the path to a boot image or configuration file, as follows:

**Table 47-6** *Images Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Image File | <p>Enter the path to and name of the configuration file to add to the ordered Boot Images list.</p> <p>On a PIX device, you can use only the “flash” syntax; that is:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b>/<i>[path]/filename</i></li> </ul> <p>On an ASA, you can use any of the following syntactical constructs:</p> <ul style="list-style-type: none"> <li>• <b>disk0:</b>/<i>[path]/filename</i></li> </ul> <p>The value “disk0” represents the internal flash card. You can also use “flash” instead of “disk0,” as they are aliased:</p> <ul style="list-style-type: none"> <li>– <b>flash:</b>/<i>[path]/filename</i></li> <li>• <b>disk1:</b>/<i>[path]/filename</i></li> </ul> <p>The value “disk1” represents the external flash card.</p> <p>In addition, on an ASA, you can specify an ASDM image file on a TFTP server, as follows</p> <ul style="list-style-type: none"> <li>• <b>tftp:</b>//<i>[user[:password]@]server[:port]/[path]/filename</i></li> </ul> <p>Note that you can specify only one TFTP location, and it must be listed first in the Boot Images table on the Boot Image/Configuration page.</p> |

## Setting the Device Clock

Use the Clock page to set the date and time on the selected device.

**Note**

This page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

To dynamically set the time using an NTP server, see [NTP Page, page 51-19](#); time derived from an NTP server overrides any time set manually on the Clock page.

**Note**

In multiple-context mode, set the time in the system context only.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Clock** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Clock** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 47-7**      *Clock Page*

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Time Zone                    | <p>Choose a time zone for the device. These options represent Greenwich Mean Time (GMT) plus or minus a number of hours.</p> <p><b>Note</b> Changing the time zone on the device may drop the connection to any installed Security Services modules (SSMs).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Daylight Savings Time (Summer Time) | <p>Choose a daylight savings time option, and if necessary, specify when and how daylight savings time is applied:</p> <p><b>None</b> – Choose this option to disable automatic correction for daylight savings time.</p> <p><b>Set by Date</b> – Choose this option to specify the date and time when daylight savings time begins and ends for a specific year. If you use this option, you will need to reset the dates every year.</p> <p><b>Set by Day</b> – Choose this option to specify the start and end dates for daylight saving time using the month, week, and day on which daylight savings time begins and ends. This option also lets you set a recurring date range that you do not need to alter yearly.</p> |

#### Set by Date

The following three parameters appear in a Start section and an End section. Use the two sets to define when daylight savings time starts and ends.

|        |                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date   | Enter the date on which daylight savings time begins or ends, in MMM DD YYYY format (for example, Jul 15 2011). You also can click the calendar icon to select the date from a pop-up calendar. |
| Hour   | Choose the hour, from 00 to 23, in which daylight savings time begins or ends.                                                                                                                  |
| Minute | Choose the minute, from 00 to 59, at which daylight savings time begins or ends.                                                                                                                |

#### Set by Day

|                        |                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Specify Recurring Time | Check this box to enable the Start and End parameters, which are used to set a recurring start and end for daylight savings time that you do not need to alter yearly. |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following five parameters appear in a Start section and an End section. Use the two sets to define when daylight savings time starts and ends.

|       |                                                                                                                                                                                                                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Month | Choose the month in which daylight savings time begins or ends.                                                                                                                                                                                                                                                                   |
| Week  | Choose the week of the month in which daylight savings time begins or ends. You can select a numerical value that corresponds to the week—1 through 4—or you can specify the first or last week in the month by choosing <b>first</b> or <b>last</b> . For example, if the day might fall in the partial fifth week, choose last. |

**Table 47-7** Clock Page (Continued)

| Element | Description                                                                      |
|---------|----------------------------------------------------------------------------------|
| Weekday | Choose the day of the week on which daylight savings time begins or ends.        |
| Hour    | Choose the hour, from 0 to 23, in which daylight savings time begins or ends.    |
| Minute  | Choose the minute, from 00 to 59, at which daylight savings time begins or ends. |

## Configuring Device Credentials

Use the Credentials page to specify the user credentials Security Manager will use when contacting this device. You can also change the Enable password and the Telnet/SSH password on the device.

This user name-password combination lets you log into the device (in EXEC mode) if you connect to the security appliance using an HTTP, HTTPS, Telnet, or SSH session. You also can specify a separate password specifically for Telnet and SSH sessions. (Further, you can define separate credentials for HTTP/HTTPS connections on the [Device Credentials Page, page 3-44](#) in the Device Properties window.)

The Enable password lets you access privileged EXEC mode after you log in.

**Tip**

The Username, Password, and Enable Password on this page are linked to the Credentials settings in the Device Properties window. When you update these parameters and then deploy the changes to the device, Security Manager uses the existing credentials defined in the Device Properties to log into the device and deploy changes. After successful deployment, the Device Properties credentials are updated to match these settings. For more information about Credentials in Device Properties, see [Device Credentials Page, page 3-44](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Credentials** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Credentials** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Warning**

**Since several user accounts may exist on each device, applying a shared Credentials policy to multiple devices will update only the Enable Password on each device; the Username and Password provided in the shared policy are not applied (nor is the Telnet/SSH password). The Enable Password is sufficient for subsequent access to PIX/ASA/FWSM devices, unless external authentication such as AAA or TACACS+ is configured, in which case the Enable Password alone is not sufficient. In this situation, you must manually update the Username, Password and Enable Password on each device that uses external authentication.**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username                       | Enter a user name for logging into the device. The name must be at least four characters; the maximum is 64 characters. Entries are case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                      |
| Password<br>Confirm            | Provide a password for logging into the device (EXEC mode) with the specified Username. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.<br><br>Re-enter the user password in the Confirm field.<br><b>Note</b> We recommend a password length of at least 8 characters.                                                                                                                                                                                                       |
| Privilege Level                | Choose a privilege level for this user; available values are 1 through 15. Level 1 allows EXEC-mode access only, the default level for log-in; level 15 allows Privileged EXEC-mode access; that is, access to the Enable mode. Other levels must be explicitly defined on the device.                                                                                                                                                                                                                                                   |
| Enable Password<br>Confirm     | You can specify an Enable password that lets this user access Privileged EXEC mode after logging in. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.<br><br>Re-enter the Enable password in the Confirm field.<br><b>Note</b> If you configure user authentication for Enable access, each user has their own password and this password is not used. See <a href="#">Configuring AAA - Authentication Tab, page 47-5</a> for more information.                               |
| Telnet/SSH Password<br>Confirm | You can specify a password that provides access to EXEC mode when connecting to the device via a Telnet or SSH session. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.<br><br>Re-enter the Telnet/SSH password in the Confirm field.<br><b>Note</b> If you configure user authentication for Telnet or SSH access, each user has their own password and this password is not used. See <a href="#">Configuring AAA - Authentication Tab, page 47-5</a> for more information. |

## CHAPTER 48

# Configuring Device Access Settings on Firewall Devices

---

The Device Access section, located under the Device Admin folder in the Policy selector, contains pages for defining access to firewall devices.

This chapter contains the following topics:

- [Configuring Console Timeout, page 48-1](#)
- [HTTP Page, page 48-2](#)
- [Configuring ICMP, page 48-3](#)
- [Configuring Management Access, page 48-5](#)
- [Configuring Secure Shell Access, page 48-5](#)
- [Configuring SNMP, page 48-7](#)
- [Telnet Page, page 48-13](#)

## Configuring Console Timeout

Use the Console page to specify a timeout value for inactive console sessions. When the time limit you specify is reached, the console session is closed.

In the **Console Timeout** field, enter the number of minutes a console session can remain idle before the device closes it. Valid values are 0 to 60 minutes. To prevent a console session from timing out, enter 0.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Console** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Console** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [Chapter 48, “Configuring Device Access Settings on Firewall Devices”](#)

# HTTP Page

Use the table on the HTTP page to manage the interfaces configured to access the HTTP server on a device, as well as HTTP redirect to HTTPS on those interfaces. You also can enable or disable the HTTP server on the device from this page. Administrative access by the specific device manager requires HTTPS access.

**Note**

To redirect HTTP, the interface requires an access list that permits HTTP. Otherwise, the interface cannot listen to port 80, or to any other port that you configure for HTTP.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference**

**Table 48-1** HTTP Page

| Element              | Description                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP Interface table | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage device interfaces on which HTTP-to-HTTPS redirect is configured. Add Row and Edit Row open the <a href="#">HTTP Configuration Dialog Box, page 48-2</a> . |
| Enable HTTP Server   | Enables or disables the HTTP server on the device. When enabled, you can specify a communications <b>Port</b> for the server. The Port range is 1 to 65535; the default is 443.                                                        |

## HTTP Configuration Dialog Box

Use the HTTP Configuration dialog box to add or edit a host or network that will be allowed to access the HTTP server on the device via a specific interface; you also can enable and disable HTTP redirect.

**Navigation Path**

You can access the HTTP Configuration dialog box from the [HTTP Page, page 48-2](#).

**Field Reference**

**Table 48-2** HTTP Configuration Dialog Box

| Element        | Description                                                                                |
|----------------|--------------------------------------------------------------------------------------------|
| Interface Name | Enter or Select the interface on which access to the HTTP server on the device is allowed. |

**Table 48-2 HTTP Configuration Dialog Box (Continued)**

| Element                           | Description                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address/Netmask                | Enter the IP address and netmask, separated by a forward slash (“/”) of the host or network that is permitted to establish an HTTP connection with the device. Alternately, you can click Select to select a Networks/Hosts object. |
| Enable Authentication Certificate | Select this option to require user certificate authentication in order to establish an HTTP connection. On ASA and PIX 8.0(2)+ devices, you can specify the authentication <b>Port</b> .                                            |
| Redirect port                     | The port on which the security appliance listens for HTTP requests, which it then redirects to HTTPS. To disable HTTP redirect, ensure that this field is blank.                                                                    |

## Configuring ICMP

Use the table on the ICMP page to manage Internet Control Message Protocol (ICMP) rules, which specify the addresses of all hosts or networks that are allowed or denied ICMP access to specific interfaces on the security device.

The ICMP rules control ICMP traffic that terminates on any device interface. If no ICMP control list is configured, the device accepts all ICMP traffic that terminates at any interface, including the outside interface. However, by default, the device does not respond to ICMP echo requests directed to a broadcast address.

It is recommended that permission is always granted for the ICMP Unreachable message (type 3). Denying ICMP Unreachable messages disables ICMP Path MTU discovery, which can halt IPsec and PPTP traffic. See RFC 1195 and RFC 1435 for details about Path MTU Discovery.

If an ICMP control list is configured, the device uses a first match to the ICMP traffic, followed by an implicit deny all. That is, if the first matched entry is a permit entry, the processing of the ICMP packet continues. If the first matched entry is a deny entry, or an entry is not matched, the device discards the ICMP packet and generates a syslog message. If an ICMP control list is not configured, a permit rule is assumed in all cases.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > ICMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > ICMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 48-3** ICMP Page

| Element                            | Description                                                                                                                                                                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ICMP Rules Table                   | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage ICMP rules. Add Row opens the Add ICMP dialog box, while Edit Row opens the Edit ICMP dialog box. See <a href="#">Add and Edit ICMP Dialog Boxes, page 48-4</a> for information about these dialog boxes. |
| <b>ICMP Unreachable Parameters</b> |                                                                                                                                                                                                                                                                                        |
| Rate Limit                         | For ICMP traffic that terminates at an interface on this device, the maximum number of ICMP Unreachable messages the device can transmit per second. This value can be between 1 and 100 messages per second; the default is 1 message per second.                                     |
| Burst Size                         | The burst size for ICMP Unreachable messages; this can be a value between 1 and 10.<br><b>Note</b> This parameter is not currently used by the system, so you can choose any value.                                                                                                    |

## Add and Edit ICMP Dialog Boxes

Use the Add ICMP dialog box to add an ICMP rule, which specifies a host/network that is allowed or denied the specified ICMP access on the specified device interface.

**Note**

The Edit ICMP dialog box is virtually identical to the Add ICMP dialog box, and is used to modify existing ICMP rules. The following descriptions apply to both dialog boxes.

**Navigation Path**

You can access the Add or Edit ICMP dialog boxes from the [Configuring ICMP, page 48-3](#).

**Field Reference****Table 48-4** Add and ICMP Dialog Boxes

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action       | Whether this rule permits or denies the selected ICMP Service message from the specified Network on the specified Interface. Choose: <ul style="list-style-type: none"> <li><b>Permit</b> – ICMP messages from the specified networks/hosts are allowed to the specified interface.</li> <li><b>Deny</b> – ICMP messages from the specified networks/hosts to the specified interface are dropped.</li> </ul> |
| ICMP Service | Enter or Select the specific ICMP service message to which the rule applies.                                                                                                                                                                                                                                                                                                                                  |
| Interface    | Enter or Select the device interface to which these ICMP messages are directed.                                                                                                                                                                                                                                                                                                                               |

**Table 48-4 Add and ICMP Dialog Boxes (Continued)**

| Element | Description                                                                                                      |
|---------|------------------------------------------------------------------------------------------------------------------|
| Network | Enter a host name or IP address, or Select a Networks/Hosts object, to define the specified ICMP message source. |

## Configuring Management Access

Use the Management Access page to enable or disable access on a high-security interface so you can perform management functions on the device. You can enable this feature on an internal interface to allow management functions to be performed on the interface over an IPsec VPN tunnel. You can enable the Management Access feature on only one interface at a time.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Management Access** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Management Access** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Enabling and Disabling Management Access

In the **Management Access Interface** field, enter the name of the device interface that is to permit management access connections. You can click Select to select the interface from a list of interface objects.

You can enable the Management Access feature on only one interface at a time.

Clear the Management Access Interface field to disable management access.

## Configuring Secure Shell Access

Use the Secure Shell page to configure rules that permit administrative access to a security device using the SSH protocol. The rules restrict SSH access to a specific IP address and netmask. Any SSH connection attempts that comply with these rules must then be authenticated by an AAA server or Telnet password.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

Table 48-5 Secure Shell Page

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| SSH Version         | Specify the SSH version(s) accepted by the device: choose <b>1</b> , <b>2</b> , or <b>1 and 2</b> . By default, SSH Version 1 and SSH Version 2 connections are accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Timeout             | Enter the number of minutes, 1 to 60, the Secure Shell session can remain idle before the device closes it. The default value is 5 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Allowed Hosts table | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage the hosts allowed to connect to the security device via SSH. Add Row opens the Add Host dialog box, while Edit Row opens the Edit Host dialog box. See <a href="#">Add and Edit SSH Host Dialog Boxes, page 48-6</a> for information about these dialog boxes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Secure Copy  | <p>Check this box to enable the secure copy (SCP) server on the security appliance. This allows the appliance to function as an SCP server for transferring files from/to the device. Only clients that are allowed to access the security appliance using SSH can establish a secure copy connection.</p> <p>This implementation of the secure copy server has the following limitations:</p> <ul style="list-style-type: none"> <li>• The server can accept and terminate connections for secure copy, but cannot initiate them.</li> <li>• The server does not have directory support. The lack of directory support limits remote client access to the security appliance internal files.</li> <li>• The server does not support banners.</li> <li>• The server does not support wildcards.</li> <li>• The security appliance license must have the VPN-3DES-AES feature to support SSH version 2 connections.</li> </ul> |

## Add and Edit SSH Host Dialog Boxes

Use the Add Host dialog box to add an SSH access rule.

### Note

The Edit Host dialog box is virtually identical to the Add Host dialog box, and is used to modify existing SSH access rules. The following descriptions apply to both dialog boxes.

### Navigation Path

You can access the Add and Edit Host dialog boxes from the [Configuring Secure Shell Access, page 48-5](#).

**Field Reference****Table 48-6 Add and Edit Host Dialog Boxes**

| Element      | Description                                                                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | Enter or Select the name of the device interface on which SSH connections are permitted.                                                                                                                                                                                     |
| IP Addresses | Enter the name or IP address for each host or network that is permitted to establish an SSH connection with the security device on the specified interface; use commas to separate multiple entries. You also can click Select to select Networks/Hosts objects from a list. |

## Configuring SNMP

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1 and 2c, as well as traps and SNMP read access; SNMP write access is not supported.

You can configure a security appliance to send “traps” (event notifications) to a network management station (NMS), or you can use the NMS to browse the management information bases (MIBs) on the security appliance. Use CiscoWorks for Windows or any other SNMP MIB-II-compliant browser to receive SNMP traps and browse a MIB.

The security appliance has an SNMP agent that notifies designated management stations if specified events occur, for example, when a link in the network goes up or down. The notification includes an SNMP system object ID (OID), identifying the device to the management stations. The security appliance SNMP agent also replies when a management station asks for information.

### SNMP MIBs and OIDs

An SNMP trap reports significant events occurring on a network device, most often errors or failures. SNMP traps are defined in Management Information Bases (MIBs), which can be either standard or enterprise-specific.

Standard traps and MIBs are created by the Internet Engineering Task Force (IETF) and documented in various RFCs. Standard traps are compiled into the security appliance software. If needed, you can also download RFCs, standard MIBs, and standard traps from the IETF website: <http://www.ietf.org/>.

For Cisco MIB files and OIDs, refer to:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>. OIDs may be downloaded from this FTP site: <ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>.

- [SNMP Page, page 48-8](#)

## SNMP Terminology

Here are definitions for some common SNMP terms:

- **Agent** – The SNMP server running on the security appliance. The agent responds to requests for information and action from the management station. The agent also controls access to its management information base (MIB), the collection of data objects that can be viewed or changed by the SNMP manager.
- **Management stations** – The PCs or workstations set up to monitor SNMP events and manage devices such as the security appliance. Management stations can also receive messages about events which require attention, such as hardware failures.
- **MIBs** – The agent maintains standardized data structures called Management Information Bases (MIBs), used to collect information, such as packet, connection and error counters, and buffer usage and failover status. A number of MIBs are defined for specific products, and for the common protocols and hardware standards used by most network devices. SNMP management stations can browse MIBs, or request only specific fields. In some applications, MIB data can be modified for administrative purposes.
- **OID** – The SNMP standard assigns a system object ID (OID) so that a management station can uniquely identify network devices with SNMP agents, and indicate to users the source of information monitored and displayed.
- **Traps** – Specified events that generate a message from the SNMP agent to the management station. Events include alarm conditions such as linkup, linkdown, coldstart, authentication, or syslog events.

## SNMP Page

Use the SNMP page to configure the security appliance for monitoring by Simple Network Management Protocol (SNMP) management stations.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Read Community String<br>Confirm      | Enter the password used by a SNMP management station when sending requests to this device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. The security device uses the password to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces are not permitted.<br><br>Repeat the password in the <b>Confirm</b> field to ensure it was entered correctly. |
| System Administrator Name             | Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.                                                                                                                                                                                                                                                                                                |
| Location                              | Describe the location of this security device (for example, <b>Building 42, Sector 54</b> ). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.                                                                                                                                                                                                                                                                       |
| Port (PIX 7.x, ASA and FWSM 3.x only) | Specify the port on which incoming requests will be accepted. The default is 161.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Configure SNMP Traps                  | Click this button to configure SNMP traps in the <a href="#">SNMP Trap Configuration Dialog Box, page 48-9</a> .                                                                                                                                                                                                                                                                                                                                                                                            |
| SNMP Hosts table                      | This table lists the SNMP management stations that can access the security appliance. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, as described in <a href="#">Using Tables, page 1-45</a> .<br><br>The Add Row and Edit Row buttons open the <a href="#">Add SNMP Host Access Entry Dialog Box, page 48-12</a> , used to add and edit management station host entries.                                                                                        |

## SNMP Trap Configuration Dialog Box

Use the SNMP Trap Configuration dialog box to configure SNMP traps (event notifications) for the selected security device.

Traps are different than browsing; they are unsolicited “comments” from the managed device to the management station for certain events, such as *linkup*, *linkdown*, and *syslog event generated*.

An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device. The SNMP service running on a security device performs two functions:

- Replies to SNMP requests from management stations.
- Sends traps to management stations or other devices that are registered to receive them from the security appliance.

Cisco security devices support three types of traps:

- firewall
- generic
- syslog

In the SNMP Trap Configuration dialog box, available traps are presented on four tabbed panels: Standard, Entity MIB, Resource, and Other.

### Navigation Path

You can access the SNMP Trap Configuration dialog box from the [SNMP Page, page 48-8](#).

| Other   | <ul style="list-style-type: none"> <li>• <b>IPSec Start</b> – IPsec has started, as indicated in the notification.</li> <li>• <b>IPSec Stop</b> – IPsec has stopped, as indicated in the notification.</li> <li>• <b>IKEv2 Start</b> – Internet Key Exchange version 2 (IKEv2) exchange initiated.</li> <li>• <b>IKEv2 Stop</b> – Internet Key Exchange version 2 (IKEv2) exchange terminated.</li> <li>• <b>Memory Threshold</b> – Available free memory has fallen below configured threshold, as indicated in the notification.</li> <li>• <b>Remote Access Session Threshold Exceeded</b> – The number of remote access sessions has reach the defined limit, as indicated in the notification.</li> <li>• <b>CPU Rising Threshold</b> – This notification is triggered when utilization of CPU resources exceeds the specified Percentage for a specified Period of time: <ul style="list-style-type: none"> <li><b>Percentage</b> – Enter the desired upper limit of CPU resource usage as a percentage of total available. Value values range from 10 to 94; default is 70%.</li> <li><b>Period</b> – Specify the length of time, in minutes, that the specified Percentage can be exceeded before notification is triggered. Value values range from 1 to 60.</li> </ul> </li> <li>• <b>Interface Threshold</b> – This notification is triggered when utilization of a physical interface exceeds the specified Percentage of total bandwidth: <ul style="list-style-type: none"> <li><b>Percentage</b> – Enter the desired upper limit on interface usage as a percentage of total available bandwidth. Value values range from 30 to 99; default is 70%.</li> </ul> </li> <li>• <b>NAT Packet Discard</b> – This notification is generated when IP packets are discarded by the NAT function. Available Network Address Translation addresses or ports have fallen below configured threshold.</li> </ul> |

## Add SNMP Host Access Entry Dialog Box

Use the Add SNMP Host Access Entry dialog box to add and edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the security device.

### Navigation Path

You can access the Add SNMP Host Access Entry dialog box from the [SNMP Page, page 48-8](#).

### Related Topics

- [Configuring SNMP, page 48-7](#)
- [SNMP Trap Configuration Dialog Box, page 48-9](#)

**Field Reference****Table 48-9 Add SNMP Host Access Entry Dialog Box**

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                    | Enter or Select the interface on which this SNMP management station contacts the device.                                                                                                                                                                                                                                                                                                                                                                                |
| IP Address                        | Enter the IP address, or Select a Networks/Hosts object, representing the SNMP management station.                                                                                                                                                                                                                                                                                                                                                                      |
| UDP Port                          | (Optional) Enter a UDP port for requests from the SNMP host. You can use this field to override the global value specified on the SNMP page.                                                                                                                                                                                                                                                                                                                            |
| Community String<br>Confirm       | Enter the password used by the SNMP management station when sending requests to the security device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. Thus, the password is used to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces are not permitted.<br><br>Repeat the password in the <b>Confirm</b> field. |
| SNMP Version                      | Choose the version of SNMP used by this management station: <b>1</b> or <b>2c</b> .                                                                                                                                                                                                                                                                                                                                                                                     |
| Server Poll/Trap<br>Specification | Specify the type(s) of communication with this management station: poll only, trap only, or both trap and poll. Check either or both: <ul style="list-style-type: none"> <li>• Poll – The security device waits for periodic requests from the management station.</li> <li>• Trap – The device sends trap events when they occur.</li> </ul>                                                                                                                           |

## Telnet Page

Use the Telnet page to configure rules that permit only specific hosts or networks to connect to the firewall device using the Telnet protocol.

The rules restrict administrative Telnet access through a firewall device interface to a specific IP address and netmask. Connection attempts that comply with the rules must then be authenticated by a preconfigured AAA server or the Telnet password. You can monitor Telnet sessions using Monitoring > Telnet Sessions.

**Note**

Only five Telnet sessions can be active at the same time in single-context mode. In multiple-context mode on ASAs, there can be only five Telnet sessions active per context, 100 Telnet sessions active per blade. With resource class, the administrator can further tune this parameter.

**Related Topics****Navigation Path**

|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name       | Enter or Select an interface that can receive Telnet packets from a client.                                                                                                                                                                                                                                                                                                             |
| IP Addresses/Netmask | Enter or Select the IP address and netmask, separated by a “/”, of each host or network permitted to access the firewall device’s Telnet console through the specified interface. Use commas to separate multiple entries.<br><br><b>Note</b> To limit access to a single IP address, use 255.255.255.255 or 32 as the netmask. Do not use the subnetwork mask of the internal network. |

## CHAPTER 49

# Configuring Failover

---

The Failover page provides access to failover settings for the selected security appliance. The available settings and the overall appearance of the Failover page may change slightly, depending upon the type of device selected, its mode of operation (routed or transparent), and its context mode (single or multiple).

In other words, how you configure failover depends upon both the operating mode and the security context of the security appliance.

Please note the following caveats when assigning an interface as a failover link:

- You can define the interface in the Add/Edit Interface dialog box, but do not configure it. In particular, **do not specify an interface Name**, as this parameter disqualifies the interface from being used as the failover link. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#) for more information.
- IPv6 addresses are not supported for failover links.
- On an ASA 5505, an interface assigned as the backup for another interface cannot be used as a failover link (although no checking is performed to prevent this).
- Do not assign a PPPoE-enabled interface as a failover link. PPPoE and Failover should not be configured on the same device interface (although no checking is performed to prevent this).
- A failover interface cannot use the same IP address as another interface, especially the Management IP address (although no checking is performed to prevent this).

Note also that after you assign an interface as a failover link, the interface is listed on the Interfaces page, but you cannot edit or delete the interface from that page. The only exception is if you set a physical interface to be the stateful failover link—you can configure its speed and duplex.

This chapter contains the following topics:

- [Understanding Failover, page 49-1](#)
- [Basic Failover Configuration, page 49-5](#)
- [Additional Steps for an Active/Standby Failover Configuration, page 49-9](#)
- [Failover Policies, page 49-10](#)

## Understanding Failover

Failover lets you configure two identical security appliances such that one will take over firewall operations if the other fails. Using a pair of security appliances, you can provide high system availability without operator intervention.

The linked security appliances communicate failover information over a dedicated link. This failover link can be either a LAN-based connection or, on PIX security appliances, a dedicated serial failover cable. The following information is communicated over the failover link:

- Current failover state (active or standby)
- “Hello” messages (also called “keep-alives”)
- Network link status
- MAC address exchange
- Configuration replication
- Per-connection state information, in the case of Stateful failover

**Caution**

---

All information sent over the failover link is sent in clear text unless you secure the communication with a failover key. If the security appliance is used to terminate VPN tunnels, this information includes any user names, passwords, and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing failover communications with a failover key, particularly if you are using the security appliance to terminate VPN tunnels.

---

Cisco security appliances support two types of failover:

- **Active/Standby** – The *active* security appliance inspects all network traffic, while the *standby* security appliance remains idle until a failure occurs on the active appliance. Changes to the configuration of the active security appliance are transmitted over the failover link to the standby security appliance.

When failover occurs, the standby security appliance becomes the active unit, and it assumes the IP and MAC addresses of the previously active unit. Because other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time-out anywhere on the network.

Active/Standby failover is available to security appliances operating in single- or multiple-context mode. In single-context mode, only Active/Standby failover is available, and all failover configuration is by means of the Failover page.

**Note**

---

When using Active/Standby failover, you must make all configuration changes on the active unit. The active unit automatically replicates the changes to the standby unit. The standby unit should not be imported or added to the Security Manager device list.

Also, you must manually copy the authentication certificate from the active device to the standby device. See [Additional Steps for an Active/Standby Failover Configuration](#), page 49-9 for additional information.

---

- **Active/Active** – Both security appliances inspect network traffic by alternating their roles—such that one is active and one is standby—on a per context basis. This means Active/Active failover is available only on security appliances operating in multiple-context mode.

However, Active/Active failover is not required in multiple-context mode. That is, on a device operating in multiple-context mode, you can configure Active/Standby or Active/Active failover. In either case, you provide system-level failover settings in the system context, and context-level failover settings in the individual security contexts.

See [Active/Active Failover](#), page 49-3 for additional information about this topic.

In addition, failover can be stateless or stateful:

- **Stateless** – Also referred to as “regular” failover. With stateless failover, all active connections are dropped when failover occurs. Clients need to re-establish connections when the new active unit takes over.
- **Stateful** – The active unit in the failover pair continually passes per-connection state information to the standby unit. When failover occurs, the same connection information is available on the new active unit. Supported end-user applications are not required to reconnect to maintain the current communication session.

See [Stateful Failover, page 49-4](#) for more information.

#### Related Topics

- [Chapter 49, “Configuring Failover”](#)
- [Basic Failover Configuration, page 49-5](#)
- [Failover Policies, page 49-10](#)

## Active/Active Failover

Active/Active failover is available only on security appliances operating in multiple-context mode. In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.

The active and standby roles are assigned over the complete set of security contexts, more or less arbitrarily.

To enable Active/Active failover on the security appliance, you must assign the security contexts to one of two failover groups. A failover group is simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default.

As in Active/Standby failover, each unit in an Active/Active failover pair is given a primary or secondary designation. Unlike Active/Standby failover, this designation does not indicate which unit is active when both units start simultaneously. Each failover group in the configuration is given a primary or secondary role preference. This preference determines the unit on which the contexts in the failover group appear in the active state when both units start simultaneously. You can have both failover groups be in the active state on a single unit in the pair, with the other unit containing the failover groups in the standby state. However, a more typical configuration is to assign each failover group a different role preference to make each one active on a different unit, balancing the traffic across the devices.

#### Note

To reliably manage security contexts in Active/Active failover mode, Cisco Security Manager requires an IP address for the management interface of each context so that it can communicate directly with the active security context of a failover pair.

Initial configuration synchronization occurs when one or both units start. This synchronization occurs as follows:

- When both units start simultaneously, the configuration is synchronized from the primary unit to the secondary unit.

- When one unit starts while the other unit is already active, the unit that is starting up receives the configuration from the already active unit.

After both units are running, commands are replicated from one unit to the other as follows:

- Commands entered within a security context are replicated from the unit on which the security context is in the active state to the peer unit.

---

**Note** A context is considered in the active state on a unit if the failover group to which it belongs is in the active state on that unit.

---

- Commands entered in the system execution space are replicated from the unit on which failover group 1 is in the active state to the unit on which failover group 1 is in the standby state.
- Commands entered in the admin context are replicated from the unit on which failover group 1 is in the active state to the unit on which failover group 1 is in the standby state.

Failure to enter the commands on the appropriate unit for command replication to occur will cause the configurations to be out of synchronization. Those changes may be lost the next time the initial configuration synchronization occurs.

---

**Note** When bootstrapping the peer devices in an Active/Active Failover configuration, the bootstrap configurations are only applied to the system contexts of the respective failover peer devices.

---

In an Active/Active failover configuration, failover occurs on a failover group basis, not a system basis. For example, if you designate both failover groups as active on the primary unit, and failover group 1 fails, failover group 2 remains active on the primary unit, while failover group 1 becomes active on the secondary unit.

---

**Note** When configuring Active/Active failover, make sure that the combined traffic for both units is within the capacity of each unit.

---

## Stateful Failover

---

**Note** Stateful failover is not supported on the ASA 5505 appliance.

---

When stateful failover is enabled, the active unit in the failover pair continually updates the current connection-state information on the standby unit. When failover occurs, supported end-user applications are not required to reconnect to maintain the current communication session.

---

**Note** The IP and MAC addresses for the state and LAN failover links do not change at failover.

---

To employ stateful failover, you must configure a link to pass all state information to the standby unit. If you are using a LAN failover connection rather than the serial failover interface (which is available only on the PIX platform), you can use the same interface for the state link and the failover link. However, we recommend that you use a dedicated interface for passing state information to the standby unit.

The following information is passed to the standby unit when stateful failover is enabled:

- NAT translation table
- TCP connection table (except for HTTP), including the timeout connection
- HTTP connection states (if HTTP replication is enabled)
- H.323, SIP and MGCP UDP media connections
- The system clock
- The ISAKMP and IPsec SA table

The following information is not copied to the standby unit when stateful failover is enabled:

- HTTP connection table (unless HTTP replication is enabled)
- The user authentication (UAUTH) table
- The ARP table
- Routing tables

## Basic Failover Configuration

The following steps describe basic failover configuration. Please note the following caveats when assigning an interface as a failover link:

- You can define the interface in the Add/Edit Interface dialog box, but do not configure it. In particular, **do not specify an interface Name**, as this parameter disqualifies the interface from being used as the failover link.
- On an ASA 5505, an interface assigned as the backup for another interface cannot be used as a failover link (although no checking is performed to prevent this).
- Do not assign a PPPoE-enabled interface as a failover link. PPPoE and Failover should not be configured on the same device interface (although no checking is performed to prevent this).
- A Failover interface cannot use the same IP address as another interface, especially the Management IP address (although no checking is performed to prevent this).

### Note

When you save a failover configuration, it is applied to both the security appliance and the failover peer.

### Before You Begin

Licenses installed on the device must allow failover configurations. On ASA 5505 and 5510 devices, this failover license is an optional license. You must install the failover license outside of Security Manager, using ASDM or the device CLI, and ensure that the **License Supports Failover** option is selected in the General page of the device properties (right-click the device and select **Device Properties**). If the license is installed when you add the device to the inventory, or you install the license and then rediscover device policies, Security Manager can identify the license and set this option appropriately.

If the option is selected and the license is not in fact installed, you will see deployment failures. If the option is not selected, Security Manager will not deploy the failover policy to the device even if you configure the policy.

### Related Topics

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#)
- [Understanding Failover, page 49-1](#)

- [Additional Steps for an Active/Standby Failover Configuration](#), page 49-9
- [Failover Policies](#), page 49-10

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

**Note** For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager](#), page 5-28.

**Step 2** Select the appliance you want to configure.

**Step 3** Expand the **Platform** entry in the Device Policy selector, then expand **Device Admin** and select **Failover**.

The Failover page is displayed.

**Step 4** (PIX only) Choose the **Failover Method: Serial Cable** or **LAN Based**. If you choose Serial Cable, the LAN Failover settings are disabled; be sure the cable connecting the two devices is in place.

**Step 5** Select **Enable Failover** to enable failover on this appliance.

**Step 6** (Optional) Click the Settings button to open the Settings dialog box for the selected device. The contents of the Settings dialog box depend on the type of device, and whether it is operating in single or multiple mode—some options may not be available. Refer to the following sections:

- [Settings Dialog Box](#), page 49-20 (ASA/PIX 7+)
- [Advanced Settings Dialog Box](#), page 49-15 (FWSM)

**Step 7** Click the **Bootstrap** button to open the Bootstrap configuration for LAN failover dialog box, which provides bootstrap configurations that can be applied to the primary and secondary devices in a LAN failover configuration. See [Bootstrap Configuration for LAN Failover Dialog Box](#), page 49-26 for more information.

**Step 8** (Multiple-context devices only) In the Configuration section, select the failover mode: **Active/Active** or **Active/Standby**.

**Step 9** (Optional) Follow these steps to configure an interface for **LAN Failover** communications between the two devices:

- Assign a device **Interface** for LAN-based communications, and then press the Tab key on your keyboard to update the page.

On PIX and ASA devices, this drop-down list displays the interfaces defined on the device. You can type in a port ID (e.g., *gigabitethernet1*), or you can choose the port if you have already defined the interface.

On an FWSM, the Interface list is not populated with VLAN IDs; you must enter the numeric ID of the VLAN you wish to use.

**Note** In both cases, this cannot be a Named interface, nor can the interface be configured for PPPoE.

- Provide a **Logical Name** for this failover interface.
- Enter the **Active IP** address for failover communications.
- Enter a **Standby IP** address for failover communications. The Standby IP address is used on the security appliance that is currently the standby unit.

e. Enter the **Subnet Mask** for both IP addresses. Both must be on the same subnet.

**Step 10** (Optional) Follow these steps to enable and configure an interface for **Stateful Failover** communications between the two devices:

a. Assign a device **Interface** for update communications, and then press the Tab key on your keyboard to update the page.

You can type in a port ID (e.g., *gigabitethernet1*), or you can choose the port if you have already defined the interface; note that this cannot be a Named interface.

**Note** On an FWSM, this is a **VLAN** interface.

b. Provide a **Logical Name** for this interface.

c. Enter the **Active IP** address for connection updates.

d. Enter a **Standby IP** address for update communications.

e. Enter the **Subnet Mask** for both IP addresses. Both must be on the same subnet.

f. Select **Enable HTTP Replication** to preserve HTTP connection information.

Connection information is communicated to the standby unit for all TCP protocols except HTTP, because HTTP connections are generally short-lived. Select this option to maintain HTTP connections during failover.

**Step 11** Provide a communications-encryption key: enter a **Shared Key** and then repeat it in the **Confirm** field. Be sure to enter the same key on both devices. (Not available on FWSM versions prior to 3.1)

The Shared Key can be any arbitrary string of up to 63 alphanumeric characters. If **HEX** is checked, the Shared Key is an arbitrary string of exactly 32 hexadecimal characters. (The HEX option is available only on PIX/ASA version 7.0.5 and later, and FWSM versions 3.1.3 and later.)

**Note** This step is optional, but we strongly recommend encrypting failover communications.

**Step 12** To specify a failover reconnect timeout value for asymmetrically routed sessions, enter a length of time in the **Timeout** field, in the form hh:mm:ss (the minutes and seconds values are optional). If the field is blank (the default), or contains a zero, reconnections are prevented. Setting this value to -1 disables the timeout, allowing connections to reconnect after any amount of time.

**Step 13** (FWSM only) – Configured interfaces are listed in the Interface Configuration table. To edit the failover configuration for a listed interface, select it and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box](#), page 49-23.

## Adding a Security Context to Failover Group 2

To add a new security context to an existing failover group 2, you must save the new context configuration to a deployment file and then manually add it to the appropriate device. Otherwise, until the first successful deployment, Security Manager will attempt to communicate with the new context through the device's Admin context. This will fail since group 2 cannot be reached through the Admin context (unless both group 1 and 2 are active on the same device).

The following steps outline creating a new security context and adding it to failover group 2.

1. Create the new security context.

Be sure to define: context Name, Configuration URL, assign an Interface, choose Failover Group 2, and provide a Management IP Address. See “Managing Security Contexts” for more information.

2. Save and submit these changes.

3. Provide the following context-configuration information, saving each change as you go:

- On the Credentials page of the Device Properties window for the new context, provide Username and Password. See “Viewing or Changing Device Properties” for additional information.
- On the context’s Interfaces page, edit the assigned interface, providing a Name, IP address and Subnet Mask. See “Managing Device Interfaces” for additional information.
- On the context’s [Failover Page \(ASA/PIX 7.0+\), page 49-17](#), edit the interface configuration to provide a Standby IP Address.
- On the “HTTP Page”, check Enable HTTP Server and then define HTTP access.
- On the Credentials page, provide the Username and Password to be used when contacting the context. See “Configuring Device Credentials” for additional information.

4. Choose **Deploy** from the Configuration Manager’s File menu. Submit your changes, and then in the Deploy Saved Changes dialog box, be sure only this new context is selected, and then click Edit Deploy method. In the Edit Deploy Method dialog box, change the Method to File and then specify the Destination and a file name. Click OK to close the Edit Deploy Method dialog box, and then click Deploy the Deploy Saved Changes dialog box.

The context configuration is saved to the specified file. See “Deploying to a File” for more information about this step.

5. After uploading the configuration file to the device, use the CLI to enable HTTP access for the context. For example:

```
ciscoasa/group2(config-if)# int g3/0
ciscoasa/group2(config-if)# nameif man
ciscoasa/group2(config-if)# security-level 100
ciscoasa/group2(config-if)# ip add 203.0.113.176 255.255.254.0 st 203.0.113.177
ciscoasa/group2(config-if)# exit
ciscoasa/group2(config)# http serv ena
ciscoasa/group2(config)# http 0.0.0.0 0.0.0.0 man
ciscoasa/group2(config)# username cisco pass cisco
ciscoasa/group2(config)#wr
```

Following this process, any new changes to the context can be successfully deployed to the context with Security Manager (attempts to reach the context will not go through the Admin context’s management IP address).

### Alternative

Another approach to this issue is to add the new context to failover group 1 first, and then perform the configuration via Security Manager. However, in order to then move this context to failover group 2, both groups (1 and 2) must be active on the same device. Otherwise, this error will be reported:

```
"join-failover-group 2
ERROR: Command requires failover-group 2 and 1 to be in the same state or no nameif
command for all interfaces in this context"
```

# Additional Steps for an Active/Standby Failover Configuration

Cisco Security Manager lets you authenticate a PIX/ASA/FWSM device by validating the certificate installed on the device. When configuring firewalls in an active/standby failover configuration, you must manually copy the certificate from the active device to the standby device so that Security Manager can communicate with the standby device after a failover occurs.

The following procedures describe how to export or display the identity certificate, CA certificate, and keys for a security appliances in your network using ASDM, and then import that information onto a standby device using ASDM.

- [Exporting the Certificate to a File or PKCS12 data, page 49-9](#)
- [Importing the Certificate onto the Standby Device, page 49-9](#)

## Exporting the Certificate to a File or PKCS12 data

To export a trustpoint configuration, follow these steps using ASDM:

- 
- Step 1** Go to Configuration > Features > Device Administration > Certificate > Trustpoint > Export.
- Step 2** Fill in the Trustpoint Name, Encryption Passphrase, and Confirm Passphrase fields. For information on these fields, click Help.
- Step 3** Select a method for exporting the trustpoint configuration.
- Export to a File—Type the filename or browse for the file.
  - Display the trustpoint configuration in PKCS12 format—Display the entire trustpoint configuration in a text box and then copy it for importing. For more information, click Help.
- Step 4** Click **Export**.
- 

## Importing the Certificate onto the Standby Device

To import a trustpoint configuration, follow these steps using ASDM:

- 
- Step 1** Go to Configuration > Features > Device Administration > Certificate > Trustpoint > Import.
- Step 2** Fill in the Trustpoint Name, Decryption Passphrase, and Confirm Passphrase fields. For information on these fields, click Help. The decryption passphrase is the same as the encryption passphrase used when the trustpoint configuration was exported.
- Step 3** Select a method for importing the trustpoint configuration.
- Import from a File—Type the filename or browse for the file.
  - Enter the trustpoint configuration in PKCS12 format—Paste the entire trustpoint configuration from the exported source into a text box. For more information, click Help.
-

# Failover Policies

This section lists the pages that describe configuring failover on various types of security appliances; the pages are organized by device type.

## PIX 6.x Firewalls

- [Failover Page \(PIX 6.3\)](#), page 49-10
  - [Edit Failover Interface Configuration Dialog Box \(PIX 6.3\)](#), page 49-11
  - [Bootstrap Configuration for LAN Failover Dialog Box](#), page 49-26

## Firewall Services Modules

- [Failover Page \(FWSM\)](#), page 49-12
  - [Advanced Settings Dialog Box](#), page 49-15
  - [Add/Edit Interface MAC Address Dialog Box](#), page 49-22
  - [Edit Failover Interface Configuration Dialog Box](#), page 49-23
  - [Bootstrap Configuration for LAN Failover Dialog Box](#), page 49-26

## Adaptive Security Appliances and PIX 7.0 Firewalls

- [Failover Page \(ASA/PIX 7.0+\)](#), page 49-17
  - [Settings Dialog Box](#), page 49-20
  - [Edit Failover Group Dialog Box](#), page 49-24
  - [Edit Failover Interface Configuration Dialog Box](#), page 49-23
  - [Add/Edit Interface MAC Address Dialog Box](#), page 49-22
  - [Bootstrap Configuration for LAN Failover Dialog Box](#), page 49-26

## Failover Page (PIX 6.3)

Use the Failover page to configure failover settings for a PIX 6.3.x Firewall.

### Navigation Path

Select a PIX 6.3.x device in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

| Failover Method    | Choose the type of failover link: <b>Serial Cable</b> or <b>LAN Based</b> . If you choose Serial Cable, ensure the physical cable is connected to both devices.                                                                                                                                                                         |
| Enable Failover    | Check this box to enable failover on this device. Ensure that both devices have the same software version, activation key type, flash memory, and RAM.<br><br>On PIX devices with LAN Based chosen as the Failover Method, you must next configure the logical LAN Failover interface and, optionally, the stateful failover interface. |
| Bootstrap button   | Click to display the Bootstrap Configuration for LAN Failover dialog box. See <a href="#">Bootstrap Configuration for LAN Failover Dialog Box, page 49-26</a> for more information.                                                                                                                                                     |
| Failover Poll Time | Specify the amount of time between hello messages among units. Values can range from 3 to 15 seconds; default is 15.                                                                                                                                                                                                                    |

**LAN-Based Failover**

These fields are available when LAN Based is the chosen Failover Method.

|                       |                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface             | Choose the interface to be used for LAN-based failover. If “Not Selected” is chosen, LAN-based failover is disabled.                                               |
| Shared Key<br>Confirm | Used to encrypt communications between the primary and standby devices. Value can be any alphanumeric string.<br><br>Re-enter the Shared Key in the Confirm field. |

**Stateful Failover**

(Optional) To configure [Stateful Failover, page 49-4](#), provide the following parameters.

|                         |                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface               | Choose the interface to be used for Stateful Failover. If “Not Selected” is chosen, Stateful Failover is disabled.<br><br><b>Note</b> You must choose a fast LAN link from the list (for example, 100full, 1000full, or 1000sxfull). |
| Enable HTTP Replication | When selected, active HTTP sessions are copied to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                        |

**Interface Configuration**

The table lists all available named interfaces. To define a Standby IP address and Active and Standby MAC addresses for an interface, select it in the list and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box \(PIX 6.3\), page 49-11](#).

**Edit Failover Interface Configuration Dialog Box (PIX 6.3)**

Use the Edit Failover Interface Configuration dialog box to configure failover interfaces for the selected PIX 6.3.x device.

**Note**

The failover interface cannot be configured for PPPoE.

**Navigation Path**

You can access the Edit Failover Interface Configuration dialog box from the Interface Configuration table on the [Failover Page \(PIX 6.3\)](#), page 49-10.

**Related Topics**

- [Failover Policies](#), page 49-10

**Field Reference**

**Table 49-2** *Edit Failover Interface Configuration Dialog Box (PIX 6.3)*

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface          | The name of the interface; read-only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Active IP Address  | <p>Displays the IP address of the active interface. This address is used by the standby device to communicate with the active device. The address must be on the same network as the system IP address.</p> <p>The active IP address of this interface; read-only. This address is used by the standby device to communicate with the active device. This field is blank if an IP address has not been assigned to the interface.</p> <p><b>Tip</b> You can use this IP address with the ping tool to check the status of the active device.</p> |
| Netmask            | The subnet mask for the active IP address; read-only. This field is blank if an IP address has not been assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Standby IP Address | <p>Specify the IP address of the corresponding interface on the standby failover unit. This address is used by the active device to communicate with the standby device. The address must be on the same network as the system IP address.</p> <p>This field does not appear if an IP address has not been assigned to the interface.</p> <p><b>Tip</b> You can use this IP address with the ping tool to check the status of the standby device.</p>                                                                                            |

**Failover MAC Addresses**

These parameters let you define virtual MAC addresses for a physical interface that is configured for failover; these addresses are optional.

|                     |                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------|
| Active MAC Address  | Specify a MAC address for the active interface in hexadecimal format (for example, 0123.4567.89ab).  |
| Standby MAC Address | Specify a MAC address for the standby interface in hexadecimal format (for example, 0123.4567.89ab). |

## Failover Page (FWSM)

Use the Failover page to configure basic failover settings for the selected Firewall Services Module (FWSM).

**Navigation Path**

To access this feature, select a FWSM in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

**Field Reference****Table 49-3 Failover Page (FWSM)**

| Element         | Description                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Failover | Check this box to enable failover on this device. Ensure that both devices have the same software version, activation key, flash memory, and RAM.<br><br>You must next configure the logical LAN Failover interface and, optionally, the stateful failover interface. |
| Settings button | Click to display the <a href="#">Advanced Settings Dialog Box, page 49-15</a> , used to define when failover should occur.                                                                                                                                            |

**Configuration**

This section is presented only for FWSM 3.1.1+ devices operating in multiple-context mode.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active/Active  | In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.<br><br>To enable Active/Active failover on the device, you must assign the security contexts to one of two failover groups. A failover group is a simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default. See <a href="#">Add/Edit Security Context Dialog Box (FWSM), page 57-5</a> for information about assigning a context to a failover group. |
| Active/Standby | In an Active/Standby configuration, the active security appliance handles all network traffic passing through the failover pair. The standby security appliance does not handle network traffic until a failure occurs on the active security appliance. Whenever the configuration of the active security appliance changes, it sends configuration information over the failover link to the standby security appliance.<br><br>When a failover occurs, the standby security appliance becomes the active unit. It assumes the IP and MAC addresses of the previously active unit. Because the other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time out.                                                                                                                             |

| Element                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Shared Key</b> (FWSM 3.1.1+ only)                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| The options in this section let you encrypt the communications between the active and standby devices by providing a shared encryption key. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Caution</b>                                                                                                                              | All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If this device is used to terminate VPN tunnels, this information includes any user names, passwords and shared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communications with a shared key. |
| Shared Key                                                                                                                                  | Enter any string of characters up to 63 numbers, letters and punctuation characters. This string is used to generate the encryption key.                                                                                                                                                                                                                                                                                                                              |
| Confirm                                                                                                                                     | Re-enter this string the <b>Confirm</b> field.<br>If you select <b>HEX</b> , the entry in the Shared Key and Confirm fields must be exactly 32 hexadecimal characters (0-9, a-f).                                                                                                                                                                                                                                                                                     |

**Interface Configuration**

This table is presented on the Failover page for devices operating in single-context mode, or for individual security contexts only.

The table lists all available named interfaces. To enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box](#), page 49-23. Select or deselect **Monitor this interface for failure**.

**Advanced Settings Dialog Box**

The Advanced Settings dialog box lets you configure additional failover settings for the selected FWSM.

**Note**

The following reference table describes all fields that can be presented in the Advanced Settings dialog box. The fields actually presented depend on operating mode (routed or transparent) and whether the device is hosting single or multiple contexts.

**Navigation Path**

You can access the Advanced Settings dialog box by clicking the Settings button on the [Failover Page \(FWSM\)](#), page 49-12.

**Related Topics**

- [Failover Policies](#), page 49-10

**Field Reference****Table 49-4 Advanced Settings Dialog Box**

| Element                                                             | Description                                                                                                                             |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Policy</b>                                             |                                                                                                                                         |
| Select a failed-interfaces option and provide an appropriate value. |                                                                                                                                         |
| Number of failed interfaces                                         | When the number of failed monitored interfaces exceeds this value, the security appliance fails over. Valid values range from 1 to 250. |
| Percentage of failed interfaces                                     | When the number of failed monitored interfaces exceeds this percentage, the security appliance fails over.                              |

**Failover Poll Time**

These fields define how often hello messages are sent on the failover link, and how long to wait before testing the peer for failure if no hello messages are received.

|                     |                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unit Failover       | The amount of time between hello messages between failover units. Enter a value between 1 and 15 seconds, or if <b>msec</b> is checked, between 500 and 999 milliseconds.                                                           |
| Unit Hold Time      | The amount of time to wait for a hello message on the failover link, after which the unit begins testing for peer failure. Enter a value between 3 and 45 seconds. This value must be at least three times the Unit Failover value. |
| Monitored Interface | The amount of time between polls among interfaces. Enter a value between 3 and 15 seconds.                                                                                                                                          |

**MAC Address Mapping**

In Active/Standby mode, this table lists interface-virtual MAC address mappings. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, which are described in [Using Tables, page 1-45](#).

To add or edit interface mappings, click the Add Row or Edit Row button to open the [Add/Edit Interface MAC Address Dialog Box, page 49-22](#).

**Failover Groups**

In Active/Active mode, this table lists both failover groups. To edit failover parameters for either group, select it in the list and click the Edit Row button to open the [Edit Failover Group Dialog Box, page 49-24](#).

**Bridge Group Configuration**

In single-context transparent mode, this table lists all currently defined bridge groups (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups, page 45-14](#)). To add a standby IP address to a bridge group, select it in the list and click the Edit Row button to open the [Edit Failover Bridge Group Configuration Dialog Box, page 49-16](#).

**Edit Failover Bridge Group Configuration Dialog Box**

Use this dialog box to add a standby IP address to a failover bridge group.

**Navigation Path**

You can access the Edit Failover Bridge Group Configuration dialog box as follows:

- On the Failover page presented for an individual security context in transparent mode on an ASA.

- From the Bridge Group Configuration table in the [Advanced Settings Dialog Box, page 49-15](#) presented by an FWSM in transparent mode.

#### Field Reference

**Table 49-5** *Edit Failover Bridge Group Configuration Dialog Box*

| Element         | Description                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Name            | Identifies the bridge group; not editable.                                                                        |
| IP Address      | Identifies the IP address assigned to the bridge group; not editable.                                             |
| Network Mask    | Identifies the subnet mask for the IP Address; not editable.                                                      |
| Standby Address | Enter the IP address of the standby bridge group; this address must be on the same subnet as the primary address. |

## Failover Page (ASA/PIX 7.0+)

Use the Failover page to configure basic failover settings for ASA and PIX 7.0+ security devices

#### Note

The features and options presented on the Failover page vary according to type of device selected, operating system version, firewall mode (routed or transparent), and security contexts (single or multiple). Thus, some of the elements described in the following table may not appear on the Failover page for your currently selected device.

#### Navigation Path

Select an ASA or PIX 7.0+ in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

Ensure that both devices have the same software version, activation key type, flash memory, and RAM.</p> <p>On PIX devices with LAN Based chosen as the Failover Method, and on all ASAs, you must next configure the logical LAN Failover interface and, optionally, the stateful failover interface.</p>                                                                                                                                                                                                                                                                                                                                                                |
| Bootstrap button | Click to display the Bootstrap Configuration for LAN Failover dialog box. See <a href="#">Bootstrap Configuration for LAN Failover Dialog Box, page 49-26</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Settings button  | Click to display the <a href="#">Settings Dialog Box, page 49-20</a> , used to define when failover should occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Timeout          | <p>The failover Timeout specifies the amount of time after a system boots or becomes active that “nailed” sessions are accepted; used in conjunction with static translation rules (see <a href="#">Static Rules Tab, page 23-25</a> for more information).</p> <p>Enter a value in this field to specify the failover reconnect timeout value for asymmetrically routed sessions. The value is in the form hh:mm:ss (hours:minutes:seconds); both minutes and seconds are optional.</p> <p>Valid values for the number of hours are -1 to 1193; the default value is 0, which means connections cannot be re-established. Setting this value to -1 disables the timeout, allowing reconnections after any amount of time.</p> |

### Configuration

This section is presented only for devices operating in multiple-context mode.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Active/Active | <p>In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.</p> <p>To enable Active/Active failover on the security appliance, you must assign the security contexts to one of two failover groups. A failover group is a simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default. See <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA), page 57-7</a> for information about assigning a context to a failover group.</p> |

| Element                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active/Standby                                                                                           | <p>In an Active/Standby configuration, the active security appliance handles all network traffic passing through the failover pair. The standby security appliance does not handle network traffic until a failure occurs on the active security appliance. Whenever the configuration of the active security appliance changes, it sends configuration information over the failover link to the standby security appliance.</p> <p>When a failover occurs, the standby security appliance becomes the active unit. It assumes the IP and MAC addresses of the previously active unit. Because the other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time out.</p> |
| <b>LAN Failover</b>                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Interface                                                                                                | <p>Choose the interface to use as the failover link; all interfaces available on the device are listed.</p> <p>When configured for failover, the interface is directly connected to the standby device.</p> <p><b>Note</b> You can choose an EtherChannel interface as the failover link. As with any other type of interface assigned as a failover link, the EtherChannel interface cannot be named, and none of the EtherChannel's member interfaces can be named. Further, while being used as an active failover link, changes to the interface configuration are not allowed. Refer to <a href="#">Configuring EtherChannels, page 45-8</a> for more information.</p>                                                    |
| Logical Name                                                                                             | Enter a logical name for the failover interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Active IP Address                                                                                        | Specify the active IP address for this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Standby IP Address                                                                                       | <p>Specify a standby IP address for this interface.</p> <p>To receive packets from both units in a failover pair, standby IP addresses need to be configured on all interfaces. The Standby IP address is used on the security appliance that is currently the standby unit, and it must be in the same subnet as the active IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| Subnet Mask                                                                                              | Enter the Subnet Netmask for the active and standby IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Stateful Failover</b>                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| (Optional) To configure <a href="#">Stateful Failover, page 49-4</a> , provide the following parameters. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Interface                                                                                                | <p>Choose the interface to use for the stateful failover link; all interfaces available on the device are listed.</p> <p><b>Note</b> You can choose an EtherChannel interface as the stateful failover link. As with any other type of interface assigned as a failover link, the EtherChannel interface cannot be named, and none of the EtherChannel's member interfaces can be named. Further, while being used as an active failover link, changes to the interface configuration are not allowed. Refer to <a href="#">Configuring EtherChannels, page 45-8</a> for more information.</p>                                                                                                                                 |

**Table 49-6** Failover Page (ASA/PIX 7.0+) (Continued)

| Element                 | Description                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logical Name            | Enter the logical name of the interface on the active firewall device to communicate with standby device for failover. When configured for stateful failover, the interface is directly connected to the standby device. |
| Active IP Address       | Specify the IP address of the active interface.                                                                                                                                                                          |
| Standby IP Address      | Specify the IP address of the standby interface.                                                                                                                                                                         |
| Subnet Mask             | Enter the Subnet Netmask for the active and standby IP addresses.                                                                                                                                                        |
| Enable HTTP Replication | When selected, active HTTP sessions are copied to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.            |

**Key**

The options in this section let you encrypt the communications between the active and standby devices. Select the type and provide a string of characters to produce the shared encryption key.

**Caution**

All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If this device is used to terminate VPN tunnels, this information includes any user names, passwords and shared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communications with a shared key.

|            |                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Any string | If you select <b>Any string</b> , the entry in the Shared Key field can be any combination of up to 63 numbers, letters and punctuation characters. This string is used to generate the encryption key.<br><br>If you select <b>HEX</b> , the entry in the Shared Key and Confirm fields must be exactly 32 hexadecimal characters (0-9, a-f). This string is used as the encryption key. |
| HEX        |                                                                                                                                                                                                                                                                                                                                                                                           |
| Shared Key | Enter any string of characters appropriate to the selected key type: Any string or HEX.                                                                                                                                                                                                                                                                                                   |
| Confirm    | Re-enter the string the <b>Confirm</b> field.                                                                                                                                                                                                                                                                                                                                             |

**Interface Configuration**

(in some instances, labeled Monitor Interface Configuration)

This table is presented on the Failover page for ASA 8.4.1+ devices operating in single-context, transparent mode, and for individual contexts on PIX/ASA devices. Otherwise, it appears in the [Settings Dialog Box, page 49-20](#).

The table lists all available named interfaces. To enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box, page 49-23](#). Select or deselect **Monitor this interface for failure**.

## Settings Dialog Box

The Settings dialog box lets you define criteria for when failover should occur on the selected ASA or PIX 7.x appliance.

### Navigation Path

You can access the Settings dialog box by clicking the Settings button on the [Failover Page \(ASA/PIX 7.0+\)](#), page 49-17.

#### Note

The following reference table presents all fields that can be presented in the Settings dialog box. The fields actually presented depend on operating mode (routed or transparent) and whether the device is hosting single or multiple contexts.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Policy</b>         |                                                                                                                                                                                                                                                                                                                                                |
| Number of failed interfaces     | When the number of failed monitored interfaces exceeds this value, the security appliance fails over. The range is between 1 and 250 failures.                                                                                                                                                                                                 |
| Percentage of failed interfaces | When the number of failed monitored interfaces exceeds this percentage, the security appliance fails over.                                                                                                                                                                                                                                     |
| <b>Failover Poll Time</b>       |                                                                                                                                                                                                                                                                                                                                                |
| Unit Failover                   | The amount of time between hello messages among units. The range is between 1 and 15 seconds, or between 200 and 999 milliseconds if the <b>Change units to msec</b> option is checked.                                                                                                                                                        |
| Unit Hold Time                  | Sets the time during which a unit must receive a hello message on the failover link, or the unit begins the testing process for peer failure. The range is between 3 and 45 seconds, or between 800 and 999 milliseconds if the <b>msec</b> option is checked. You cannot enter a value that is less than three times the Unit Failover value. |
| Monitored Interface             | The amount of time between polls among interfaces. The range is between 3 and 15 seconds, or between 500 and 999 milliseconds if the msec option is checked.                                                                                                                                                                                   |
| Interface Hold Time             | Sets the time during which a data interface must receive a hello message, after which the peer is declared failed. Valid values are from 5 to 75 seconds. This value must be at least five times the Unit Failover value.                                                                                                                      |

### Failover Groups

In Active/Active mode, this table lists both failover groups. To edit failover parameters for either group, select it in the list and click the Edit Row button to open the [Edit Failover Group Dialog Box](#), page 49-24.

**Table 49-7 Settings Dialog Box (Continued)**

| Element                                                                                                                                                                                                                                                                                                       | Description                                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>MAC Address Mapping</b>                                                                                                                                                                                                                                                                                    |                                                                                                                      |
| In Active/Standby mode, this table lists interface-virtual MAC address mappings. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, which are described in <a href="#">Using Tables, page 1-45</a> .                                                                   |                                                                                                                      |
| To add or edit interface mappings, click the Add Row or Edit Row button to open the <a href="#">Add/Edit Interface MAC Address Dialog Box, page 49-22</a> .                                                                                                                                                   |                                                                                                                      |
| <b>Monitor Interface Configuration</b>                                                                                                                                                                                                                                                                        |                                                                                                                      |
| In single-context mode, this table lists all available named interfaces. To define a Standby IP address for, and enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Interface Configuration Dialog Box, page 49-23</a> . |                                                                                                                      |
| <b>Management IP Address</b>                                                                                                                                                                                                                                                                                  |                                                                                                                      |
| In single-context transparent mode, this section presents the management IP address and netmask defined for the device (on the <a href="#">Management IP Page, page 46-10</a> ); you cannot change these values.                                                                                              |                                                                                                                      |
| Standby                                                                                                                                                                                                                                                                                                       | Enter the management IP address of the standby unit; this address must be on the same subnet as the primary address. |

### Add/Edit Interface MAC Address Dialog Box

The Add/Edit Interface MAC Address dialog box lets you define virtual MAC addresses for a physical interface on ASA, FWSM 3.x and PIX 7.x security appliances that are configured for failover (not available on ASA 5505 devices).

In Active/Standby failover, the MAC addresses for the primary unit are always associated with the active IP addresses. If the secondary unit boots first and becomes active, it uses the burned-in MAC address for its interfaces. When the primary unit comes online, the secondary unit obtains the MAC addresses from the primary unit. This change can disrupt network traffic. You can configure virtual MAC addresses for each interface to ensure that the secondary unit uses the correct MAC addresses when it is the active unit, even if it comes online before the primary unit. If you do not specify virtual MAC addresses, the failover pair uses the burned-in MAC addresses.

**Note**

You cannot configure a virtual MAC address for the failover or Stateful Failover links. The MAC and IP addresses for those links do not change during failover.

**Navigation Path**

You can open the Add/Edit Interface MAC Address dialog box from the [Settings Dialog Box, page 49-20](#).

**Field Reference****Table 49-8 Add/Edit Interface MAC Address Dialog Box**

| Element            | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| Physical Interface | Choose the physical interface on which failover virtual MAC addresses are to be configured.                |
| <b>MAC Address</b> |                                                                                                            |
| Active Interface   | Enter a virtual MAC address for the active interface in hexadecimal format (for example, 0023.4567.89ab).  |
| Standby Interface  | Enter a virtual MAC address for the standby interface in hexadecimal format (for example, 0023.4567.89ab). |

**Edit Failover Interface Configuration Dialog Box**

Use the Edit Failover Interface Configuration dialog box to define a standby IP address for an interface, and to specify whether the status of the interface should be monitored.

**Note**

A failover interface cannot be configured for PPPoE.

**Navigation Path**

You can access the Edit Failover Interface Configuration dialog box from the [Settings Dialog Box, page 49-20](#) (ASA/PIX 7.0+), [Advanced Settings Dialog Box, page 49-15](#) (FWSM), and from the Failover page itself for ASA 8.4.1+ devices operating in single-context transparent mode, and for individual ASA/PIX security contexts.

**Field Reference****Table 49-9 Edit Failover Interface Configuration Dialog Box**

| Element            | Description                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name     | The name of the interface; read-only.                                                                                                                                                |
| Active IP Address  | The active IP address of this interface; read-only. This field is blank if an IP address has not been assigned to the interface; for example if DHCP is enabled on the interface.    |
| Mask               | The subnet mask for the active IP address; read-only. This field is blank if an IP address has not been assigned to the interface; for example, if DHCP is enabled on the interface. |
| Standby IP Address | Specify the IP address of the corresponding interface on the standby failover unit. This field does not appear if an IP address has not been assigned to the interface.              |

**Table 49-9** *Edit Failover Interface Configuration Dialog Box (Continued)*

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Monitor this interface for failure | <p>Specifies whether this interface is monitored for failure: check this box to enable monitoring. The number of interfaces that can be monitored for the security appliance is 250.</p> <p>Hello messages are exchanged between the security appliance failover pair during every interface poll time period. The failover interface poll time is 3 to 15 seconds. For example, if the poll time is set to 5 seconds, testing begins on an interface if 5 consecutive hellos are not heard on that interface (25 seconds). Monitored failover interfaces can have the following status:</p> <ul style="list-style-type: none"> <li>• Unknown—Initial status. This status can also mean the status cannot be determined.</li> <li>• Normal—The interface is receiving traffic.</li> <li>• Testing—Hello messages are not heard on the interface for five poll times.</li> <li>• Link Down—The interface is administratively down.</li> <li>• No Link—The physical link for the interface is down.</li> <li>• Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.</li> </ul> |
| ASR Group Number                   | <p>If this interface is part of an asymmetric routing group, provide its ASR group number. Valid values for ASR group numbers are 1 through 32.</p> <p>Stateful failover must be enabled for asymmetric routing support to function properly between units in failover configurations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Edit Failover Group Dialog Box

Use the Edit Failover Group dialog box to configure failover parameters for groups of security contexts in an Active/Active failover configuration. See [Add/Edit Security Context Dialog Box \(PIX/ASA\), page 57-7](#), or [Add/Edit Security Context Dialog Box \(FWSM\), page 57-5](#), for information about assigning a context to a failover group.

#### Navigation Path

You can access the Add Failover Group dialog box from the PIX/ASA [Settings Dialog Box, page 49-20](#), or the FWSM [Advanced Settings Dialog Box, page 49-15](#).

**Field Reference****Table 49-10** *Edit Failover Group Dialog Box*

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preferred Role                              | Specifies the unit in the failover pair, primary or secondary, on which this failover group appears in the active state when both units start up simultaneously, or when the Preempt option is selected. Choose <b>Primary</b> or <b>Secondary</b> .<br><br>You can have both failover groups in the active state on a single unit in the pair; however, a more typical configuration is to assign each failover group a different role to make each one active on a different unit, balancing the traffic across the devices. |
| Poll time interval for monitored interfaces | Specify the amount of time between polling of monitored interfaces. Valid values are from 3 to 15 seconds (or 500 to 999 milliseconds if <b>msec</b> is checked).                                                                                                                                                                                                                                                                                                                                                              |
| Hold Time                                   | Specify the time period within which the group must receive a hello message, after which the other group is declared failed. Valid values are from 5 to 75 seconds.                                                                                                                                                                                                                                                                                                                                                            |
| Preempt after Reboot                        | Specifies the number of seconds that the preferred failover device should wait after rebooting before taking over as the active unit for this failover group. Valid values are from 0 to 1200 seconds.                                                                                                                                                                                                                                                                                                                         |
| Enable HTTP Replication                     | Indicates whether active HTTP sessions are copied to the standby device for this failover group as part of Stateful failover. If you do not allow HTTP replication, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link. This setting overrides the HTTP replication setting on the Failover page.                                                                                                                                                       |
| Failover Criteria                           | Select a failed-interfaces criterion for this group and specify the appropriate value: <ul style="list-style-type: none"> <li>• <b>Number of failed interfaces</b> – When this number of interfaces have failed, failover is triggered. Valid values are 1 to 250.</li> <li>• <b>Percentage of failed interfaces</b> – When this percentage of the total number of interfaces have failed, failover is triggered. Valid values are 1 to 100.</li> </ul>                                                                        |

**MAC Address Mapping**

This table displays interfaces to which active and standby MAC addresses are mapped.

## Failover Page (Security Context)

The Failover page for individual ASA and PIX 7.0+ security contexts presents the **Interface Configuration** table, which lists all available named interfaces.

You can select an interface in the table and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box, page 49-23](#), where you can specify a standby IP address and an ASR group number, and enable or disable monitoring of the interface.

For individual transparent-mode contexts on ASA 8.4.1+ devices, the Failover page also presents the **Bridge Group Configuration** table, which lists all currently defined failover bridge groups.

You can select an entry in the table and click the Edit Row button to open the [Edit Failover Bridge Group Configuration Dialog Box, page 49-16](#), where you can specify a standby IP address for the selected bridge group.

#### Navigation Path

Select a security context in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

## Bootstrap Configuration for LAN Failover Dialog Box

The Bootstrap Configuration for LAN Failover dialog box provides you with bootstrap configuration that can be applied to the primary and secondary devices in a LAN failover configuration.

#### Navigation Path

You can access the Bootstrap Configuration for LAN Failover dialog box from the Failover page. For more information about the Failover page, see:

- [Failover Page \(PIX 6.3\), page 49-10](#)
- [Failover Page \(FWSM\), page 49-12](#)
- [Failover Page \(ASA/PIX 7.0+\), page 49-17](#)

#### Related Topics

- [Failover Policies, page 49-10](#)

#### Field Reference

**Table 49-11** Bootstrap Configuration for LAN Failover Dialog Box

| Element   | Description                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary   | Contains the bootstrap configuration for the primary device. Open a console connection to the primary device and then paste this configuration to activate failover on the device.                                              |
| Secondary | Contains the bootstrap configuration for the secondary device. After the primary device becomes active, open a console connection to the secondary device and then paste this configuration to activate failover on the device. |

#### Note

For Active/Active Failover, the bootstrap configurations are only applied to the system contexts of the respective failover peer devices.

## CHAPTER 50

# Configuring Hostname, Resources, User Accounts, and SLAs

---

The following topics describe configuring the host name on a security appliance, defining and managing Resource classes on Firewall Services Modules (FWSMs) in multiple-context mode, managing user accounts in the Local user database, and monitoring service level agreements (SLAs) to perform route tracking.

This chapter contains the following topics:

- [Hostname Page, page 50-1](#)
- [Resource Management on Multi-context FWSMs, page 50-2](#)
- [Configuring User Accounts, page 50-6](#)
- [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 50-7](#)

## Hostname Page

You can use the Hostname page to specify a host name for your security device, and to specify a default domain. After the configuration file is deployed, the device uses this domain name when you do not enter a fully-qualified domain name in other commands. It also uses this domain name in RSA key generation.

The device appends this domain name to unqualified names. For example, if you set the domain name to “example.com,” and specify a syslog server by the unqualified name “jupiter,” the security appliance completes the name to “jupiter.example.com.”

When you set a host name for the security appliance, that name appears in the command line prompt. If you establish sessions to multiple devices, the host name helps you keep track of where you enter commands. The default host name depends on your platform.

In multiple-context mode, you can specify a domain name for each context, as well as the system execution space. The host name you specify in the system execution space appears in the command line prompt for all contexts. The host name that you optionally set within a context does not appear in the command line, but can be used by the banner command `$(hostname)` token.

### Navigation Path

In Device View, select a security device and then select **Platform > Device Admin > Hostname** from the Device Policy selector.

## Field Reference

Table 50-1 Hostname Page

| Element     | Description                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Name   | Enter a unique device name to help you differentiate among devices; for example, <i>PIX-510-A</i> .<br><br><b>Note</b> We recommend that you use a unique host name for each device you manage. The device name can be up to 63 alphanumeric (U.S. English) characters and can include any of the following special characters: ` ( ) + - , . / : =. |
| Domain Name | Optionally, enter a valid Domain Name System (DNS) domain name for the device; for example, <i>cisco.com</i> .                                                                                                                                                                                                                                       |

## Resource Management on Multi-context FWSMs

By default, all security contexts on a multiple-context Firewall Services Module (FWSM) have unlimited access to the resources of the FWSM, except where maximum limits per context are enforced. However, if you find that one or more contexts use too many resources, and they cause other contexts to be denied connections, for example, then you can configure resource management to limit the use of resources per context.

**Note**

The FWSM does not limit the bandwidth per context; however, the switch containing the FWSM can limit bandwidth per VLAN. See the switch documentation for more information.

The FWSM manages resources by assigning contexts to resource classes. Each context uses the resource limits set by its class. When you create a class, the FWSM does not set aside a portion of the resources for each context assigned to the class; rather, the FWSM sets the maximum limit for a context. If you oversubscribe resources, or allow some resources to be unlimited, a few contexts can “use up” those resources, potentially affecting service to other contexts.

You can set the limit for all resources together as a percentage of the total available for the device. Also, you can set the limit for individual resources as a percentage or as an absolute value.

You can oversubscribe the FWSM by assigning more than 100 percent of the resources across all contexts. For example, you can set up a class to limit connections to 20 percent per context, and then assign 10 contexts to the class for a total of 200 percent. If contexts concurrently use more than the system limit, then each context gets less than the 20 percent you intended.

The FWSM also lets you assign unlimited access to one or more resources in a class, instead of a percentage or absolute number. When a resource is unlimited, contexts can use as much of the resource as the system has available. For example, contexts A, B, and C are assigned to class “Onepercent,” which limits each class member to one percent of the system inspections per second, for a total of three percent; but the three contexts are currently only using two percent combined. On the other hand, class “Nolimit” has unlimited access to inspections. The contexts in Nolimit can use more than the 97 percent of “unassigned” inspections; they can also use the one percent of inspections not currently in use by contexts A, B, and C, even if that means that contexts A, B, and C are unable to reach their three percent combined limit. Setting unlimited access is similar to oversubscribing the FWSM, except that you have less control over how much you oversubscribe the system.

### Default Class

All contexts belong to the default class if they are not assigned to another class; you do not have to actively assign a context to the default class.

If a context belongs to a class other than the default class, those class settings always override the default class settings. However, if the other class has any settings that are not defined, then the member context uses the default class for those limits. For example, if you create a class with a two percent limit for all concurrent connections, but no other limits, then all other limits are inherited from the default class. Conversely, if you create a class with a two percent limit for all resources, the class uses no settings from the default class.

As initially configured, the default class provides unlimited access to resources for all contexts, except for the following limits, which are by default set to the maximum allowed per context:

- Telnet sessions – 5 sessions
- SSH sessions – 5 sessions
- IPSec sessions – 5 sessions
- MAC addresses – 65,535 entries

Note that you can edit the default class.

## Resources Page

Use the Resources page to configure and manage resource-management classes.

The table on this page lists all currently defined resource classes. Use the buttons below the table to manage this list:

- Add Row – Opens the Add Resource dialog box, where you can define a new class, and assign it to security contexts. See [Add and Edit Resource Dialog Boxes, page 50-3](#) for more information.
- Edit Row – For the currently selected row, opens the Edit Resource dialog box, so you can edit that class and its context assignments. See [Add and Edit Resource Dialog Boxes, page 50-3](#) for more information.
- Delete Row – Deletes the currently selected row(s); confirmation may be required.

### Navigation Path

In Device View, select the system context of an ASA or FWSM in multiple-context mode, and then select **Platform > Device Admin > Resources** from the Device Policy selector.

- [Resource Management on Multi-context FWSMs, page 50-2](#)

## Add and Edit Resource Dialog Boxes

Use the Add Resource and Edit Resource dialog boxes to add or edit resource classes and assignments for FWSM and ASA security contexts.

Except for their titles, both dialog boxes are identical; the following descriptions apply to both.

**Navigation Path**

You can access the Add Resource and Edit Resource dialog boxes from the [Resources Page, page 50-3](#).

**Related Topics**

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class Name             | Enter a name for this class; can be a string of up to 20 alphanumeric characters, and may include any of the following special characters: ` ( ) + - , . / : =.                                                                                                                                                                                                                                                              |
| <b>Limits Tab</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Note</b>            | For the following Limits, if you do not specify a value for a particular limit, the limit is inherited from the default class. If the default class does not set that limit, the limit inherits the system limit.<br><br>Also, any value you enter is considered to be that rate <i>per second</i> , unless you also check the related <b>percent</b> box, in which case the value is that percentage of the total resource. |
| TCP or UDP Connections | Sets a Rate Limit for TCP or UDP connections between any two hosts, including connections between one host and multiple other hosts. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 102400, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                 |
| Inspections (Fixups)   | Sets a Rate Limit for application inspections. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 10000 per second, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                             |
| Syslog Messages        | Sets a Rate Limit for system log messages. You can set the limit as an absolute value, or you can assign more than 100 percent if you want to oversubscribe the device.<br><br>The FWSM can support 30,000 messages per second for messages sent to the FWSM terminal or buffer. If you send messages to a syslog server, the FWSM supports 25,000 per second.                                                               |

**Table 50-2 Add and Edit Resource Dialog Boxes (Continued)**

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connections      | <p>Sets the Absolute Limit for concurrent TCP or UDP connections. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 999900, or you can assign more than 100 percent if you want to oversubscribe the device.</p> <p><b>Note</b> For concurrent connections, the FWSM allocates half of the limit to each of two network processors (NPs) that accept connections. Typically, the connections are divided evenly between the NPs. However, in some circumstances, the connections are not evenly divided, and the maximum connection limit could be reached on one NP before reaching the maximum on the other. In this case, the maximum connections allowed is less than the limit you set. The NP distribution is controlled by the switch, based on a distribution algorithm. You can adjust this algorithm on the switch (see <a href="#">Customizing the FWSM Internal Interface</a> on cisco.com), or you can adjust the connection limit upward to account for the inequity.</p> |
| Hosts            | Sets the limit for concurrent hosts that can connect through the FWSM. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 262144, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IPsec Sessions   | Sets the limit for IPsec sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 10 concurrent sessions divided between all contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SSH Sessions     | Sets the limit for SSH sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 100 concurrent sessions divided between all contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Telnet Sessions  | Sets the limit for concurrent Telnet sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 100 concurrent sessions divided between all contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| NAT Translations | Sets the limit for concurrent address translations. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 266144, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MAC Address      | (Transparent mode only) Sets the limit for concurrent MAC address entries allowed in the MAC address table. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 65535, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 50-2 Add and Edit Resource Dialog Boxes (Continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASDM                | <p>Sets the limit for ASDM management sessions (the default is 5). You can set the limit as an absolute value by entering an integer between 1 and 5, or you can enter a percentage between 3.0 and 15.0. The system allows a maximum of 80 concurrent sessions divided between all contexts.</p> <p>ASDM sessions use two HTTPS connections: one for monitoring that is always present, and one for making configuration changes that is present only when you make changes. For example, the system limit of 80 ASDM sessions represents a limit of 160 HTTPS sessions, divided between all contexts.</p> |
| Other VPN           | Sets the limit for Site-to-site VPN sessions. You cannot oversubscribe this resource; all context assignments combined cannot exceed the model limit. The sessions you assign for this resource are guaranteed to the context.                                                                                                                                                                                                                                                                                                                                                                              |
| Other VPN Burst     | Sets the limit for the number of site-to-site VPN sessions allowed beyond the amount assigned to a context with vpn other. For example, if your model supports 5000 sessions, and you assign 4000 sessions across all contexts with vpn other, then the remaining 1000 sessions are available for other vpn burst. Unlike other vpn, which guarantees the sessions to the context, other vpn burst can be oversubscribed; the burst pool is available to all contexts on a first-come, first-served basis.                                                                                                  |
| All Resources Limit | Sets a limit for all resources. If you also set the limit for a specific resource, then that limit overrides the limit you set here for all resources. You can set the limit as a percentage, or as unlimited by setting the value to <b>0</b> (when <b>percent</b> is not checked). You cannot set any other absolute value. You can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                 |
| <b>Contexts Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Available Contexts  | <p>Lists all contexts available for class assignments; contexts which already have class assignments are not displayed.</p> <p>Select one or more contexts and click the &gt;&gt; button to add the contexts to the Selected Contexts list.</p>                                                                                                                                                                                                                                                                                                                                                             |
| Selected Contexts   | <p>Lists all contexts assigned to this class.</p> <p>Select one or more contexts and click the &lt;&lt; button to return the contexts to the Available Contexts list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configuring User Accounts

The User Accounts page lets you manage the Local user database. User accounts in the Local database can be used in conjunction with the Authentication, Authorization, Accounting (AAA) functions to determine “who is allowed to do what” on a device. Refer to [About AAA on Security Devices, page 47-1](#) for more information.

The table on this page lists all currently defined Local user accounts, showing for each, the name of the user and the assigned privilege level. For a detailed explanation of these fields, see [Add/Edit User Account Dialog Boxes, page 50-7](#).

- To add a user account, click the Add Row button.

- To edit the settings for an account, select it and click the Edit Row button.
- To delete a user account, select it and click the Delete Row button.

#### Navigation Path

- (Device view) Select **Platform > Device Admin > User Accounts** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > User Accounts** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

#### Related Topics

- [Local Database, page 47-3](#)

## Add/Edit User Account Dialog Boxes

Use the Add and Edit User Account dialog boxes to add a local user account or to modify an existing user account.

#### Navigation Path

You can access the Add and Edit User Account dialog boxes from the User Accounts page, as described in [Configuring User Accounts, page 50-6](#).

#### Field Reference

**Table 50-3** Add/Edit User Account Dialog Boxes

| Element         | Description                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username        | Enter a name for this user account: must be at least four characters; the maximum is 64 characters. Entries are case-sensitive.                                                                                                          |
| Password        | Enter a unique password for this user account: must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.<br><b>Note</b> To protect security, we recommend a password length of at least 8 characters. |
| Confirm         | Re-enter the user password to confirm it.                                                                                                                                                                                                |
| Privilege Level | Choose a privilege level for this user; defines local command authorization. The range is 0 (lowest) to 15 (highest). The default privilege level is 2.                                                                                  |

## Monitoring Service Level Agreements (SLAs) To Maintain Connectivity

You can configure ASA or PIX devices that run version 7.2 or higher to perform route tracking by monitoring service level agreements. By monitoring the connectivity to a device on another network, you can track the availability of a primary route and install a backup route if the primary route fails. For example, you can define a default route to an Internet service provider (ISP) gateway and a backup

default route to a secondary ISP in case the primary ISP becomes unavailable. This technique, called Dual ISP, provides security appliances with a form of high availability, which is a vital part of providing customers with the services to which they are entitled.

Without route tracking, there is no inherent mechanism for determining if the route is up or down. A static route remains in the routing table even if the next hop gateway becomes unavailable, and is removed only if the associated interface on the security appliance goes down.

The security appliance performs route tracking by associating a route with a monitoring target that you define in an SLA monitor policy object. It monitors the target using ICMP echo requests, according to the parameters configured in the object. If an echo reply is not received within a specified time period, the SLA monitor is considered down and the associated route is removed from the routing table. A previously configured backup route is used in place of the removed route.

SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out).

This section contains the following topics:

- [Creating Service Level Agreements, page 50-8](#)

## Creating Service Level Agreements

The following procedure explains how to configure SLA monitor objects and associate them with routes and interfaces in an ASA or PIX configuration.

#### Related Topics

- [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 50-7](#)
- [Configuring Static Routes, page 54-48](#)
- [Configuring Firewall Device Interfaces, page 45-2](#)
- [Creating Policy Objects, page 6-9](#)

---

**Step 1** Create the SLA monitor policy object:

- Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager, page 6-4](#)) and select **SLA Monitors** from the table of contents.

**Tip** You can also create SLA monitor objects when defining policies that use this object type. For more information, see [Selecting Objects for Policies, page 6-2](#).

---

- Right-click in the work area and select **New Object** to open the Add SLA Monitor dialog box. For more information, see [Configuring SLA Monitor Objects, page 50-9](#).

- c. The monitoring options are appropriate for most connections, so you need only configure the following:
  - Name—The name of the object.
  - SLA Monitor ID—An identifying number for the monitoring process. The number must be unique within a device configuration.
  - Monitored Address—The address that you are monitoring. When you select a monitoring target, make sure that it can respond to ICMP echo requests (pings). The target can be any network address that you choose, but consider the use of:
    - The ISP gateway address.
    - The next hop gateway address (if you are concerned about the availability of the ISP gateway).
    - A server on the target network, such as an AAA server, with which the security appliance needs to communicate.
    - A persistent network device on the destination network. (A desktop or notebook computer that gets shut down at night is not a good choice.)
  - Interface—The interface name, or interface role that identifies an interface, that will be the source of the ICMP messages. The device pings the monitored address from this interface's IP address.
- d. Click **OK** to save the object.

**Step 2** Configure ASA/PIX policies to use the object to monitor routes. You can configure the following policies to monitor SLAs:

- **Platform > Routing > Static Route**—When you define a static route, you can select an SLA monitor object to do route tracking for the route. For more information, see [Configuring Static Routes, page 54-48](#) and [Add/Edit Static Route Dialog Box, page 54-49](#).
- **Interfaces**—When you define an interface that uses DHCP or PPPoE, you can configure the DHCP or PPPoE learned default routes to be tracked. For more information, see [Device Interface: IP Type \(PIX/ASA 7.0+\), page 45-36](#).

## Configuring SLA Monitor Objects

Use the Add or Edit SLA (Service Level Agreement) Monitor dialog box to create, edit, and copy SLA monitor objects. Each SLA monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route.

You can configure SLA monitors only for security appliances running PIX/ASA version 7.2 or higher. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out).

For more information about configuring and using SLA monitor objects, see [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity, page 50-7](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **SLA Monitors** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects, page 6-9</a> .                                                                                                                                                                                                                                                                                                                                                                         |
| Description       | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SLA Monitor ID    | The ID number of the SLA operation. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.                                                                                                                                                                                                                                                                                                                                  |
| Monitored Address | The IP address that is being monitored for availability by the SLA operation. For recommendations on selecting an address to monitor, see <a href="#">Monitoring Service Level Agreements (SLAs) To Maintain Connectivity, page 50-7</a> .                                                                                                                                                                                                                                                                                                     |
| Interface         | The source interface for all ICMP echo requests sent to the monitored address to test its availability. Enter the name of an interface or interface role, or click <b>Select</b> to select an it from a list or to create a new interface role.                                                                                                                                                                                                                                                                                                |
| Frequency         | The frequency of ICMP echo request transmissions, in seconds. Values range from 1 to 604800 seconds (7 days). The default is 60 seconds.<br><b>Note</b> The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.                                                                                                                                                                                                                                                                 |
| Threshold         | The amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds. Values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds.<br>The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.<br><b>Note</b> The threshold value should not exceed the timeout value.                                 |
| Time out          | The amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds.<br>If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.<br><b>Note</b> The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers). |

**Table 50-4 SLA Monitor Dialog Box (Continued)**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request Data Size | <p>The size of the ICMP request packet payload, in bytes. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU).</p> <p>For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used.</p> |
| ToS               | <p>The type of service (ToS) defined in the IP header of the ICMP request packet. Values range from 0 to 255. The default is 0.</p> <p>This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.</p>                                                                                                                                                                                                                      |
| Number of Packets | <p>The number of packets that are sent. Values range from 1 to 100. The default is 1 packet.</p> <p><b>Tip</b> Increase the default number of packets if you are concerned that packet loss might falsely cause the security appliance to believe that the monitored address cannot be reached.</p>                                                                                                                                                                                                                                                              |
| Category          | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |

# CHAPTER 51

## Configuring Server Access Settings on Firewall Devices

---

The Server Access section contains pages for configuring server access on firewall devices; Server Access is under Device Admin in the Device or Policy selector.

This chapter contains the following topics:

- [AUS Page, page 51-1](#)
- [DHCP Relay Page, page 51-5](#)
- [DHCP Relay IPv6 Page, page 51-7](#)
- [Configuring DHCP Servers, page 51-9](#)
- [DNS Page, page 51-13](#)
- [Configuring DDNS, page 51-17](#)
- [NTP Page, page 51-19](#)
- [SMTP Server Page, page 51-21](#)
- [TFTP Server Page, page 51-22](#)

### AUS Page

The AUS page lets you configure remote updating of a security appliance from a server that supports the Auto Update specification. Auto Update applies configuration changes and software updates to the appliance automatically from the remote server.

#### Note

The server you identify on this page must be the same server you identify in the Auto Update section of the Device Properties (from the Tools menu, choose Device Properties). The Device Properties information identifies the AUS server to which Security Manager sends configuration updates, whereas the information on this page defines for the server the device will contact for updates. Also, the Device Identity you provide in the Device Properties must match the Device ID on this page.

If you change AUS servers, note that the device will continue to use the AUS server defined in its current configuration until it receives a new configuration. Thus, you should change the AUS policy but deploy the configuration using the previous AUS server. After deployment is successful, change the Device Properties to point to the new server. For more information on deploying to AUS, see [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine, page 8-42](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > AUS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > AUS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

- [Add and Edit Auto Update Server Dialog Boxes, page 51-3](#)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Update Servers table | <p>This table lists currently configured Auto Update servers. Use the buttons below the table to manage these entries.</p> <p>The entries are listed in order of precedence for contacting AUS servers. Use the Up and Down arrow buttons to change the ordering of the list by moving the selected entry up or down.</p> <p>Use the Add Row, Edit Row, and Delete Row buttons to add, edit or delete entries. Add Row opens the Add Auto Update Server dialog box, while Edit Row opens the Edit Auto Update Server dialog box for the selected row. See <a href="#">Add and Edit Auto Update Server Dialog Boxes, page 51-3</a> for information about these dialog boxes.</p> <p><b>Note</b> The URL for contacting this AUS server is produced by concatenating the <i>Protocol://Username:Password@IP IP Address(:Port)/Path</i> provided in the Add/Edit Auto Update Server dialog boxes. The Port is included only if you entered a port number other than the default 443.</p>                    |
| Device ID Type            | <p>Choose the method used for identifying this device to the AUS server:</p> <ul style="list-style-type: none"> <li>• <b>Host Name</b> – The host name of this device, as provided in the Device Properties window (Tools &gt; Device Properties).</li> <li>• <b>Serial Number</b> – The serial number of this device.</li> <li>• <b>IP Address</b> – The IP address of the specified interface. When you choose this option, an Interface field appears; enter or Select the desired device interface.</li> <li>• <b>MAC Address</b> – The MAC address of the specified interface. When you choose this option, an Interface field appears; enter or Select the desired device interface.</li> <li>• <b>User Defined</b> – A unique user-specified ID is used. When you choose this option, a User Defined field appears; enter any alphanumeric string. Note that this string must also appear in the Device Identity field in the Device Properties window (Tools &gt; Device Properties).</li> </ul> |

Table 51-1 AUS Page (Continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Type             | <p>Choose the method defining how often the AUS server is polled for updates:</p> <ul style="list-style-type: none"> <li>• <b>At Specified Frequency</b> – If you choose this option, the Poll Period field is displayed: <ul style="list-style-type: none"> <li>– <b>Poll Period</b> – Specify the number of minutes the device waits between polls of the AUS server; valid values are 1 to 35791.</li> </ul> </li> <li>• <b>At Scheduled Time</b> – If you choose this option, the following fields are displayed (available only on ASA/PIX devices running version 7.2 or later): <ul style="list-style-type: none"> <li>– <b>Days of the week</b> – Select one or more days on which the device is to poll the AUS server.</li> <li>– <b>Polling Start Time in Hours</b> – The hour at which polling is to begin on the selected days; based on a 24-hour clock.</li> <li>– <b>Polling Start Time in Mins</b> – The minute within the chosen hour when polling is to begin.</li> <li>– <b>Enable Randomization of the Start Time</b> – Select this option to specify a random polling window; the Randomization Window field is enabled.</li> </ul> <p><b>Randomization Window</b> – The maximum number of minutes the device can use to randomize the specified polling time; valid values are 1 to 1439.</p> </li> </ul> |
| Retry Count           | The number of times the device will try to poll the AUS server for new information. Optional; if you enter zero or leave this field blank, the device will not retry after a failed poll attempt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Retry Period          | If Retry Count is not zero or blank, the number of minutes the device will wait to re-poll the AUS server if the previous attempt failed; valid values are 1 to 35791. If Retry Count is not zero or blank and you leave this field blank, the value defaults to five minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Disable Device After: | <p>Selecting this option ensures that if no response is received from the AUS server within the specified Timeout period, the security appliance will stop passing traffic.</p> <ul style="list-style-type: none"> <li>• <b>Timeout</b> – The number of minutes the firewall device will wait to timeout if no response is received from the AUS server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Add and Edit Auto Update Server Dialog Boxes

Use the Add Auto Update Server dialog box to configure a new AUS server definition. The security appliance will automatically poll this server for image and configuration updates.

The Auto Update specification allows the Auto Update server to either push configuration information and send requests for information to the security appliance, or to pull configuration information by causing the security appliance to periodically poll the Auto Update server. The Auto Update server can

also send a command to the security appliance to send an immediate polling request at any time. Communication between the Auto Update server and the security appliance requires a communications path and local CLI configuration on each security appliance.

**Note**

The URL for contacting this AUS server is produced by concatenating the `Protocol://Username:Password@IP IP Address(:Port)/Path` provided in these dialog boxes. The Port is included only if you entered a port number other than the default 443.

With the exception of the title, the Edit Auto Update Server dialog box is identical to the Add Auto Update Server dialog box. The following descriptions apply to both.

**Navigation Path**

You can access the Add and Edit Auto Update Server dialog boxes from the [AUS Page, page 51-1](#).

**Field Reference**

**Table 51-2 Add and Edit Auto Update Server Dialog Boxes**

| Element            | Description                                                                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol           | The protocol used to communicate with the AUS server; choose <b>http</b> or <b>https</b> .<br><b>Note</b> If https is selected as the protocol to communicate with the Auto Update server, the security appliance will use SSL. This requires the security appliance to have a DES or 3DES license. |
| IP Address         | Enter the IP address or Select a Networks/Hosts object representing this AUS server.                                                                                                                                                                                                                |
| Port               | Enter the number of the port on which communications with the AUS server take place. Defaults to 80 if http is chosen as the Protocol, and to 443 if https is chosen. If you enter an arbitrary port number, be sure the AUS server is configured to use the same port.                             |
| Path               | The path to AUS services on the server. The standard path is <code>autoupdate/AutoUpdateServlet</code> ; change this to <code>admin/auto-update</code> only if the AUS server host is an ASA.                                                                                                       |
| AUS Interface      | Enter or Select the interface to use when polling the Auto Update server.                                                                                                                                                                                                                           |
| Verify Certificate | Select this option to require SSL verification from the AUS server. The certificate returned by the server will be checked against Certification Authority (CA) root certificates. This requires that the AUS Server and this device use the same Certification Authority.                          |
| Username           | Enter a user name to be used for AUS authentication (optional).                                                                                                                                                                                                                                     |
| Password           | Enter the password to be used for AUS authentication (optional).                                                                                                                                                                                                                                    |
| Confirm            | Re-enter the password (optional).                                                                                                                                                                                                                                                                   |

# DHCP Relay Page

Use the DHCP Relay page to configure DHCP relay services for security devices. Dynamic Host Configuration Protocol (DHCP) relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface. To configure DHCP relay, you need to specify at least one DHCP relay server and then enable a DHCP relay agent on the interface receiving DHCP requests.

## Note

You cannot enable a DHCP relay agent on an interface where a DHCP relay server is configured. The DHCP relay agent works only with external DHCP servers; it will not forward DHCP requests to a security appliance interface configured as a DHCP server.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Relay** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Relay** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

**Table 51-3** *DHCP Relay Page*

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

See <a href="#">Add and Edit DHCP Relay Server Configuration Dialog Boxes, page 51-6</a> for more information.</p> |
| Timeout (seconds)      | Specify the amount of time, in seconds, allowed for DHCP address negotiation. Valid values range from 1 to 3600 seconds; the default value is 60 seconds.                                                                                                                                                                                                                                                                         |

## Add and Edit DHCP Relay Agent Configuration Dialog Boxes

Use the Add DHCP Relay Agent Configuration dialog box to configure and enable a DHCP relay agent on an interface. Use the Edit DHCP Relay Agent Configuration dialog box to update an existing interface relay agent.

**Note**

You cannot enable a DHCP relay agent on an interface where a DHCP relay server is configured. The DHCP relay agent works only with external DHCP servers; it will not forward DHCP requests to a security appliance interface configured as a DHCP server.

The Add DHCP Relay Agent Configuration dialog box and the Edit DHCP Relay Agent Configuration dialog box are virtually identical; the following descriptions apply to both.

**Navigation Path**

You can access the Add and Edit DHCP Relay Agent Configuration dialog boxes from the [DHCP Relay Page, page 51-5](#).

**Related Topics**

**Field Reference**

**Table 51-4 Add and Edit DHCP Relay Agent Configuration Dialog Boxes**

| Element           | Description                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface         | Enter or Select the name of the interface on which you want to configure a DHCP relay agent.                                                                                                                                                                                                                                  |
| Enable DHCP Relay | When checked, the DHCP relay is enabled on the specified interface.                                                                                                                                                                                                                                                           |
| Set Route         | Check this box to configure the DHCP relay agent to modify the default router address in the information returned from the DHCP server. When this option is selected, the DHCP relay agent substitutes the address of the selected interface for the default router address in the information returned from the DHCP server. |

## Add and Edit DHCP Relay Server Configuration Dialog Boxes

Use the Add DHCP Relay Server Configuration dialog box to define a new DHCP relay server; use the Edit DHCP Relay Server Configuration dialog box to update existing server information. You can define up to four DHCP relay servers.

**Note**

The Add DHCP Relay Server Configuration dialog box and the Edit DHCP Relay Server Configuration dialog box are virtually identical; the following descriptions apply to both.

**Navigation Path**

You can access the Add and Edit DHCP Relay Server Configuration dialog boxes from the [DHCP Relay Page, page 51-5](#).

**Related Topics**

**Field Reference****Table 51-5** Add and Edit DHCP Relay Server Configuration Dialog Boxes

| Element   | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| Server    | Enter the IP address or Select a Networks/Hosts object representing the external DHCP server to which DHCP requests are forwarded. |
| Interface | Enter or Select the interface through which DHCP requests are forwarded to the external DHCP server.                               |

## DHCP Relay IPv6 Page

Use the DHCP Relay IPv6 page to configure DHCPv6 relay services for security devices. Dynamic Host Configuration Protocol v6 (DHCPv6) relay passes DHCPv6 requests received on one interface to an external DHCPv6 server located behind a different interface. To configure DHCPv6 relay, you need to specify at least one DHCPv6 relay server and then enable a DHCPv6 relay agent on the interface receiving DHCPv6 requests.

**Note**

You cannot enable a DHCPv6 relay agent on an interface where a DHCPv6 relay server is configured. The DHCPv6 relay agent works only with external DHCPv6 servers; it will not forward DHCPv6 requests to a security appliance interface configured as a DHCPv6 server. When clustering is enabled on the device, DHCPv6 is not supported.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Relay IPv6** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Relay IPv6** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Note**

Two new interface settings have been introduced for DHCPv6: "managed-config-flag" and "other-config-flag." For more information, refer to [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), page 45-29.

**Field Reference****Table 51-6** DHCP Relay IPv6 Page

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Servers table | This table lists the interfaces on which DHCP relay IPv6 is configured. Use the Add Row, Edit Row, and Delete Row buttons to manage these entries.<br><br>The Add Row button opens the Add DHCP Relay IPv6 Server Configuration dialog box, while Edit Row opens the Edit DHCP Relay IPv6 Server Configuration dialog box. See <a href="#">Add and Edit DHCP Relay IPv6 Server Configuration Dialog Boxes, page 51-9</a> for more information. |
| Timeout (seconds)  | Specify the amount of time, in seconds, allowed for DHCPv6 address negotiation. Valid values range from 1 to 3600 seconds; the default value is 60 seconds.                                                                                                                                                                                                                                                                                    |

## Add and Edit DHCP Relay IPv6 Agent Configuration Dialog Boxes

Use the Add DHCP Relay IPv6 Agent Configuration dialog box to configure and enable a DHCPv6 relay agent on an interface. Use the Edit DHCP Relay IPv6 Agent Configuration dialog box to update an existing interface relay agent.

### Note

You cannot enable a DHCPv6 relay agent on an interface where a DHCPv6 relay server is configured. The DHCPv6 relay agent works only with external DHCPv6 servers; it will not forward DHCPv6 requests to a security appliance interface configured as a DHCPv6 server.

The Add DHCP Relay IPv6 Agent Configuration dialog box and the Edit DHCP Relay IPv6 Agent Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay IPv6 Agent Configuration dialog boxes from the [DHCP Relay IPv6 Page, page 51-7](#).

### Field Reference

**Table 51-7** Add and Edit DHCP Relay IPv6 Agent Configuration Dialog Boxes

| Element             | Description                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface           | Enter or Select the name of the interface on which you want to configure a DHCPv6 relay agent.                                                                                                                                                                                                                                        |
| Enable DHCPv6 Relay | When checked, the DHCPv6 relay is enabled on the specified interface.                                                                                                                                                                                                                                                                 |
| Set Route           | Check this box to configure the DHCPv6 relay agent to modify the default router address in the information returned from the DHCPv6 server. When this option is selected, the DHCPv6 relay agent substitutes the address of the selected interface for the default router address in the information returned from the DHCPv6 server. |

## Add and Edit DHCP Relay IPv6 Server Configuration Dialog Boxes

Use the Add DHCP Relay IPv6 Server Configuration dialog box to define a new DHCPv6 relay server; use the Edit DHCP Relay IPv6 Server Configuration dialog box to update existing server information. You can define up to four DHCPv6 relay servers.

### Note

The Add DHCP Relay IPv6 Server Configuration dialog box and the Edit DHCP Relay IPv6 Server Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay IPv6 Server Configuration dialog boxes from the [DHCP Relay IPv6 Page, page 51-7](#).

### Field Reference

**Table 51-8 Add and Edit DHCP Relay IPv6 Server Configuration Dialog Boxes**

| Element   | Description                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------|
| Server    | Enter the IP address or Select a Networks/Hosts object representing the external DHCPv6 server to which DHCPv6 requests are forwarded. |
| Interface | Enter or Select the interface through which DHCPv6 requests are forwarded to the external DHCPv6 server.                               |

## Configuring DHCP Servers

A Dynamic Host Configuration Protocol (DHCP) server provides network configuration parameters, such as IP addresses, to DHCP clients. The security appliance can provide DHCP server or DHCP relay services to DHCP clients attached to the security appliance interfaces. The DHCP server provides network configuration parameters directly to DHCP clients: DHCP relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface. For more information about DHCP relay, see [DHCP Relay Page, page 51-5](#).

### Note

The security appliance DHCP server does not support BOOTP requests.

In multiple-context mode, you cannot enable a DHCP server or DHCP relay on an interface that is used by more than one context.

You can configure a DHCP server on each interface of the security appliance, and each interface can have its own pool of addresses to draw from. However, the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.

You cannot configure a DHCP client or DHCP relay services on an interface on which the DHCP server is enabled. Additionally, DHCP clients must be directly connected to the interface on which the server is enabled.

If your firewall is also acting as a DHCP client on the outside interface, you can enable auto-negotiated IP configuration. This allows the firewall to pass the DNS, WINS and domain name parameters it gets from the outside interface (as a DHCP client) to hosts on its inside network. Alternatively, you can manually specify the DNS, WINS and domain name parameters. If you specify those parameters manually and auto-configuration is on, your values take precedence over auto-configuration.

Use the [DHCP Server Page, page 51-10](#) to manage DHCP server definitions.

## DHCP Server Page

Use the DHCP Server page to configure global DHCP server and dynamic DNS (DDNS) update options, to set up a DHCP server on one or more device interfaces, and to configure advanced server options.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ping Timeout                                 | Specify the amount of time, in milliseconds, that the firewall device waits to time out a DHCP ping attempt. To avoid address conflicts, firewall devices send two ICMP ping packets to an address before assigning that address to a DHCP client. Valid values range from 10 to 10000 milliseconds.                                                                                                                                     |
| Lease Length                                 | Specify the amount of time, in seconds, that the client can use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).                                                                                                                                                                                                                           |
| Enable auto-configuration (PIX and ASA only) | Select this option to enable DHCP auto configuration.<br>DHCP auto configuration causes the DHCP server to provide DHCP clients with DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. If any of the information obtained through auto configuration is also specified manually, the manually specified information takes precedence over the discovered information. |
| Interface                                    | If Enable auto-configuration is checked, this field is available. Enter or Select the interface running the DHCP client that supplies the DNS, WINS, and domain name parameters.                                                                                                                                                                                                                                                         |
| <b>Define settings</b> (optional)            |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Domain Name                                  | Specify the DNS domain name for DHCP clients. Enter a valid DNS domain name; for example, <code>example.com</code> .                                                                                                                                                                                                                                                                                                                     |

**Table 51-9 DHCP Server Page (Continued)**

| Element                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary DNS Server                               | Enter the IP address or Select a Networks/Hosts object representing the primary DNS server for a DHCP client.                                                                                                                                                                                                                                                                                                                                                                 |
| Primary WINS Server                              | Enter the IP address or Select a Networks/Hosts object representing the primary WINS server for a DHCP client.                                                                                                                                                                                                                                                                                                                                                                |
| Secondary DNS Server                             | Enter the IP address or Select a Networks/Hosts object representing the alternate DNS server for a DHCP client.                                                                                                                                                                                                                                                                                                                                                               |
| Secondary WINS Server                            | Enter the IP address or Select a Networks/Hosts object representing the alternate WINS server for a DHCP client.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Dynamic DNS Update</b>                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Add and Edit DHCP Server Interface Configuration Dialog Boxes

Use these dialog boxes to enable DHCP and specify a DHCP address pool for a specified interface, and to enable dynamic DNS (DDNS) updating on the interface.

### Note

Other than the titles, the two dialog boxes are identical.

### Navigation Path

You can access the Add DHCP Server Interface Configuration and Edit DHCP Server Interface Configuration dialog boxes from the [DHCP Server Page, page 51-10](#).

**Field Reference****Table 51-10 Add/Edit DHCP Server Interface Configuration Dialog Boxes**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                 | Identifies the interface on which you are configuring a DHCP server. Enter an interface name, or select an interface object.                                                                                                                                                                                                                                     |
| DHCP Address Pool         | Enter an IP address or a range of addresses, separated by a hyphen, that the DHCP server will use when assigning IP addresses. The beginning and ending addresses in the range must be in the same subnet, and the beginning address cannot be greater than the ending address.                                                                                  |
| Enable DHCP Server        | Check this box to enable a DHCP server on this interface.                                                                                                                                                                                                                                                                                                        |
| Enable Dynamic DNS Update | Check this box to enable DDNS updating by this DHCP server. Specify the record(s) to be updated: <ul style="list-style-type: none"> <li>• <b>PTR Record</b> only</li> <li>• <b>A Record and PTR Record</b></li> </ul> You also can select <b>Override DHCP Client Request</b> . If selected, DHCP server updates override any updates requested by DHCP clients. |

**Add/Edit DHCP Server Advanced Configuration Dialog Box**

The Add/Edit DHCP Server Advanced Configuration dialog box lets you manage DHCP options configured for the DHCP server. These options provide additional information to DHCP clients. For example, DHCP option 150 and DHCP option 66 provide TFTP server information to Cisco IP Phones and Cisco IOS routers.

**Navigation Path**

You can access the Add/Edit DHCP Server Advanced Configuration dialog box by clicking the Advanced button on the [DHCP Server Page, page 51-10](#).

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Option Code | Choose an option from the list of available option codes. All DHCP options (options 1 through 255) are supported except 1, 12, 50-54, 58-59, 61, 67, and 82.<br><br>Detailed information about DHCP option codes is available on cisco.com: <a href="#">DHCP Options Reference</a> .                                                                                                                                                                                                                                                                                                                                                                               |
| Type        | Choose the type of information the option returns to the DHCP client: <ul style="list-style-type: none"> <li>• <b>IP</b> – Choosing this type specifies that one or two IP addresses are returned to the DHCP client. Provide up to two IP addresses.</li> <li>• <b>ASCII</b> – Choosing this type specifies that an ASCII value is returned to the DHCP client. Provide the ASCII character string, which cannot include spaces.</li> <li>• <b>HEX</b> – Choosing this type specifies that a hexadecimal value is returned to the DHCP client. Provide the HEX string with an even number of digits and no spaces; you do not need to use a 0x prefix.</li> </ul> |

## DNS Page

Use the DNS page to configure DNS server groups. The firewall device uses these DNS servers to resolve fully-qualified domain names (host names) to IP addresses for SSL VPN, certificates, and FQDN network/host objects used in identity-aware firewall policies. Other features that define server names (such as AAA) do not support DNS resolution—you must enter the IP address or manually resolve the name to an IP address.

### Tip

The DefaultDNS server group is predefined on the ASA and is used for FQDN network/host object resolution. If you use FQDN objects, ensure that you configure DNS servers for this group; otherwise, the names cannot be resolved. To enhance security, ensure that you specify DNS servers that are trusted and that are preferably inside your network. For more information, see [Requirements for Identity-Aware Firewall Policies](#), page 13-3.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DNS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| DNS Lookup Interfaces                                  | Lists the interfaces on which you want to enable DNS lookup. Enter or Select one or more interfaces or interface roles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable DNS Guard (ASA/PIX 7.0(5), 7.2(x) and 8.x only) | <p>Check this box to enable DNS Guard for the selected device or shared policy. DNS Guard tears down the DNS session associated with a DNS query as soon as the DNS reply is forwarded by the security appliance. DNS Guard also monitors the message exchange to ensure that the ID of the DNS reply matches the ID of the DNS query.</p> <p>This command is effective only on interfaces for which DNS inspection is disabled. When DNS inspection is enabled, the DNS Guard function is always performed.</p> <p><b>Note</b> In releases prior to 7.0(5), the DNS Guard functions are always enabled regardless of the configuration of DNS inspection.</p> |

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DefaultDNS Server Group (ASA 8.4(2)+) | <p>Additional settings that apply to the DefaultDNS server group only. These settings are used when resolving FQDN network/host objects to IP addresses.</p> <ul style="list-style-type: none"> <li> <b>Poll Timer</b>—The time, in minutes, of the polling cycle used to resolve FQDN network/host objects to IP addresses. FQDN objects are resolved only if they are used in a firewall policy. The timer determines the maximum time between resolutions; the DNS entry's time-to-live (TTL) value is also used to determine when to update to IP address resolution, so individual FQDNs might be resolved more frequently than the polling cycle.<br/> The default is 240 (four hours). The range is 1 to 65535 minutes. </li> <li> <b>Expire Entry Timer</b>—The number of minutes after a DNS entry expires (that is, the TTL has passed) that the entry is removed from the DNS lookup table. Removing an entry requires that the table be recompiled, so frequent removals can increase the processing load on the device. Because some DNS entries can have very short TTL (as short as three seconds), you can use this setting to virtually extend the TTL.<br/> The default is 1 minute (that is, the entry is removed one minute after the TTL has passed). The range is 1 to 65535 minutes. </li> </ul> |

## Add DNS Server Group Dialog Box

Use the Add DNS Server Group dialog box to define the DNS servers and settings for a DNS server group, used by security devices to resolve server names to IP addresses in policies that support name resolution.

### Note

With the exception of its title, the Edit DNS Server Group dialog box is identical to this one, and the following descriptions apply to both.

### Navigation Path

You can access the Add DNS Server Group and Edit DNS Server Group dialog boxes from the [DNS Page, page 51-13](#).

### Field Reference

Table 51-14 Add/Edit DNS Server Group Dialog Boxes

| Element | Description                                                                                                                                                                                                                                                         |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name    | <p>Provide a name for the group of DNS servers.</p> <p><b>Tip</b> The name DefaultDNS is predefined on the ASA and includes the servers used for policies that do not allow the selection of a specific group, such as for FQDN network/host object resolution.</p> |

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Servers | <p>Lists the DNS servers in this group. You can specify up to six servers to which DNS requests can be forwarded. The security appliance tries each DNS server in top-to-bottom order until it receives a response.</p> <p><b>Note</b> You also must specify at least one interface on which DNS is enabled in the DNS Lookup section of the <a href="#">DNS Page, page 51-13</a>.</p> <p>Use the buttons next to this list to manage the entries; from the top down, they are:</p> <ul style="list-style-type: none"> <li>• Add a DNS server to the list; opens the <a href="#">Add DNS Server Dialog Box, page 51-16</a>.</li> <li>• Delete the currently selected DNS server entry from the list.</li> <li>• Move the currently selected entry up one row.</li> <li>• Move the currently selected entry down one row.</li> </ul> |
| Timeout     | Specify the number of seconds, from 1 to 30, to wait before trying the next DNS server; the default is 2 seconds. Each time the security device retries the list of servers, this timeout doubles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Retries     | Specify the number of times, from 0 to 10, to retry the list of DNS servers when the security device does not receive a response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Domain Name | Optionally, specify a valid DNS domain name for the server; for example, <b>dnsexample.com</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Add DNS Server Dialog Box

Use the Add DNS Server dialog box to add a DNS server to the DNS servers list in the Add DNS Server Group or Edit DNS Server Group dialog boxes.

### Navigation Path

You can access the Add DNS Server dialog box from the Add DNS Server Group or Edit DNS Server Group dialog boxes. For more information about these dialog boxes, see [Add DNS Server Group Dialog Box, page 51-15](#).

| Element         | Description                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address Type | <p>The type of IP address assigned to the DNS server, IPv4 or IPv6. This is not the type of addresses the server can resolve, but instead relates to the IP address assigned to the server itself.</p> <p>IPv6 is supported on ASA 8.4(2+) only.</p> |

**Table 51-15 Add DNS Server Dialog Box (Continued)**

| Element    | Description                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Server | The IP address, or the host network/host object that defines the address, of the DNS server. Enter the address or click <b>Select</b> to select the network/host object from a list or to create a new object. |

## Configuring DDNS

Dynamic DNS (DDNS) provides IP-address and domain-name mapping updates so hosts can find each other even though their DHCP-assigned IP addresses may change frequently. Also, beginning with the version 7.2(3), Cisco security appliances can generate DDNS updates. The DDNS page is where you configure this feature.

The DDNS mappings are maintained on the DHCP server in two types of resource records (RRs): the address or *A* records contain the name-to-IP-address mappings, while the pointer or *PTR* records map addresses to host names.

By automatically recording the association between assigned addresses and host names at defined intervals, DDNS allows frequently changing address-host name associations to be updated frequently. Mobile hosts, for example, can then move freely on a network without user or administrator intervention.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DDNS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DDNS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 51-16 DDNS Page**

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic DNS Interface Settings                     | This table lists currently defined DDNS interface-update methods. Use the Add Row, Edit Row, and Delete Row buttons below the table to manage these methods; the Add Row and Edit Row buttons open the <a href="#">Add/Edit DDNS Interface Rule Dialog Box, page 51-18</a> .                                                                      |
| DHCP Client requests DHCP Server to update records | The global setting on the appliance for DHCP client update requests. This option enables the client to send DDNS updates via the DHCP server, and specifies what is updated: the PTR resource record, both the A and PTR resource records, or neither. Choose <b>Not Selected, Only PTR Record, Both A and PTR Record</b> , or <b>No Update</b> . |
| DHCP Client ID Interface                           | Specify the interface(s) for global DHCP client update requests: enter an interface name or IP address, or Select an interface object.                                                                                                                                                                                                            |
| Enable DHCP Client Broadcast                       | Select this option to allow DHCP clients on the device to broadcast DDNS updates. Available on ASA/PIX 7.2(3)+ devices only.                                                                                                                                                                                                                      |

## Add/Edit DDNS Interface Rule Dialog Box

Use the Add/Edit DDNS Interface Rule dialog box to manage rules for dynamic DNS updates. These rules are defined on a per-interface basis.

### Navigation Path

You access the Add/Edit DDNS Interface Rule dialog box from the [Configuring DDNS, page 51-17](#).

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                                          | Enter or Select the name of the interface on which DDNS is to be configured.<br><br><b>Note</b> DHCP must be enabled on the specified interface.                                                                                                                                                                                                                                         |
| Method Name                                        | Choose a previously defined method for DDNS update, or choose <b>Add/Edit Update Method</b> to define a new method; the <a href="#">DDNS Update Methods Dialog Box, page 51-18</a> dialog box opens.                                                                                                                                                                                     |
| Hostname                                           | Enter the name of the DDNS server host to which updates will be sent.                                                                                                                                                                                                                                                                                                                    |
| DHCP Client requests DHCP Server to update records | The setting on the interface for DHCP client update requests; specifies whether the DHCP server updates the PTR resource record, both the A and PTR records, or neither.<br><br>Choose <b>Not Selected, Only PTR Record, Both A and PTR Record, or No Update</b> . Any choice other than Not Selected overrides the global setting on the <a href="#">Configuring DDNS, page 51-17</a> . |

## DDNS Update Methods Dialog Box

Use the DDNS Update Methods dialog box to manage methods for dynamic DNS updates. Each defined method specifies an update interval and the resource record(s) to be updated.

### Navigation Path

You access the DDNS Update Methods dialog box by choosing **Add/Edit Update Method** from the Method Name drop-down list in the [Add/Edit DDNS Interface Rule Dialog Box, page 51-18](#).

**Field Reference****Table 51-19 Add/Edit DDNS Update Methods Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Method Name     | Provide an identifier for this method.                                                                                                                                                                                                                                           |
| Update Interval | Specify how often records are to be updated for this method: provide a number of days, hours, minutes, and seconds. Note that while zero is the default value for hours, minutes and seconds, there is no default Day value: you must enter a number for Day.                    |
| Update Records  | Specify the resource record(s) to be updated: select <b>Not Defined</b> , <b>A Records</b> , or <b>Both A and PTR Records</b> . Selecting A Records or Both A and PTR Records overrides the setting in the <a href="#">Add/Edit DDNS Interface Rule Dialog Box, page 51-18</a> . |

# NTP Page

Network Time Protocol (NTP) is used to implement a hierarchical system of servers that provide precisely synchronized timing for network systems. This kind of accuracy is required for time-sensitive operations, such as validating Certificate Revocation Lists (CRLs), which include a precise time stamp. You can configure multiple NTP servers. The security device chooses the server with the lowest stratum—a measure of how reliable the data is.

**Note**

This page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

Use the NTP page to enable NTP and manage the NTP servers used to dynamically set the time on a security device.

**Note**

Time derived from an NTP server overrides any time set manually on the Clock page.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > NTP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference**

| Preferred                                                                                                                                                                   | If checked, this NTP server is the preferred server when multiple servers are similarly accurate.<br><br>NTP uses an algorithm to determine which server is the most accurate and synchronizes to that one. If multiple servers are of similar accuracy, then this option specifies which of those servers to use. However, if a server is significantly more accurate than the preferred one, the security appliance uses the more accurate server. For example, the security appliance uses a server of stratum 2 over a server of stratum 3 that is preferred. We recommend that you configure an NTP server as preferred only when multiple servers are likely to have the same stratum. |
| Interface                                                                                                                                                                   | Enter or Select the interface used for NTP traffic, if you want to override the default interface in to the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Authentication Key</b> The parameters in this section set the authentication key attributes if you want to use MD5 authentication for communicating with the NTP server. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Key Number                                                                                                                                                                  | Enter the ID for this authentication key. The NTP server packets must also use this key ID. If you previously configured a key ID for another server, you can select it in the list; otherwise, type a number between 1 and 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Trusted                                                                                                                                                                     | Sets this key as a trusted key. You must select this option for authentication to work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Key Value                                                                                                                                                                   | Enter the authentication key as a string up to 32 characters in length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Confirm                                                                                                                                                                     | Re-enter the authentication key to verify it is correct.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## SMTP Server Page

Use the SMTP Server page to specify the IP address of an SMTP server and optionally, the IP address of a backup server, to which e-mail alerts and notifications are sent in response to specific events.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > SMTP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > SMTP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 51-22 SMTP Server Page**

| Element                     | Description                                              |
|-----------------------------|----------------------------------------------------------|
| Primary Server IP Address   | Enter or Select the IP address of the SMTP server.       |
| Secondary Server IP Address | Enter or Select the IP address of a back-up SMTP server. |

## TFTP Server Page

The Trivial File Transfer Protocol (TFTP) is a simple client/server file transfer protocol described in RFC783 and RFC1350 Rev. 2. You can use the TFTP Server page to configure the security appliance as a TFTP client so it can transfer a copy of its running configuration file to a TFTP server. In this way, you can back up and propagate configuration files to multiple security appliances. Only one server is supported.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Server Access > TFTP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > TFTP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 51-23 TFTP Server Page**

| Element    | Description                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | Enter or Select the name of interface on which the TFTP server is accessed.                                                                                                                                                                                    |
| IP Address | Enter or Select the IP address of the TFTP server.                                                                                                                                                                                                             |
| Directory  | Enter the path on the TFTP server, beginning with a forward slash (/) and ending in the file name, to which the configuration files will be written (for example, <b>/tftpboot/asa/config3</b> ).<br><b>Note</b> The path must begin with a forward slash (/). |

## CHAPTER 52

# Configuring Logging Policies on Firewall Devices

---

The Logging feature lets you enable and manage NetFlow “collectors,” and enable system logging, set up logging parameters, configure event lists (syslog filters), apply the filters to a destination, set up syslog messages, configure syslog servers, and specify e-mail notification parameters.

After you enable logging and set up the logging parameters using the Logging Setup page, the Event Lists page lets you configure filters (for a set of syslogs) which can be sent to a logging destination. The Logging Filters page lets you specify a logging destination for the syslogs to be sent. Finally, the Syslog and E-Mail pages configure syslog and e-mail setup.

This chapter contains the following topics:

- [NetFlow Page, page 52-1](#)
- [E-Mail Setup Page, page 52-3](#)
- [Event Lists Page, page 52-4](#)
- [Logging Filters Page, page 52-7](#)
- [Configuring Logging Setup, page 52-9](#)
- [Configuring Rate Limit Levels, page 52-12](#)
- [Configuring Syslog Server Setup, page 52-15](#)
- [Defining Syslog Servers, page 52-20](#)

## NetFlow Page

A device configured for NetFlow data export captures flow-based traffic statistics on the device. This information is periodically transmitted from the device to a NetFlow collection server, in the form of User Datagram Protocol (UDP) datagrams.

The NetFlow page lets you enable NetFlow export on the selected device, and define and manage NetFlow “collectors” to which collected flow information is transmitted.

### Navigation Path

- (Device view) Select **Platform > Logging > NetFlow** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > NetFlow** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Field Reference****Table 52-1** *NetFlow Page*

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Flow Export       | If checked, NetFlow data export is enabled.                                                                                                                                                                                                                                                                                                                                               |
| Template Export Interval | Interval (in minutes) between transmissions of flow information to the collectors. The value can be from one to 3600 minutes; the default is 30.                                                                                                                                                                                                                                          |
| Active Refresh Interval  | For active connections, specifies the time interval between flow-update events in minutes. Valid values are from 1 to 60 minutes. The default value is 1 minute.                                                                                                                                                                                                                          |
| Delay Flow Create        | Delays the sending of a flow-create event by the specified number of seconds. The value can be from one to 180 seconds.<br><br>If no value is entered, there is no delay, and the flow-create event is exported as soon as the flow is created. If the flow is torn down before the configured delay, the flow-create event is not sent; an extended flow teardown event is sent instead. |
| Collectors table         | Lists the currently defined NetFlow collectors. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries.<br><br>The Add Row and Edit Row buttons open the <a href="#">Add and Edit Collector Dialog Boxes (NetFlow), page 52-2</a> .                                                                                                                     |

## Add and Edit Collector Dialog Boxes (NetFlow)

Use the Add Collector and Edit Collector dialog boxes to define and edit NetFlow “collectors.” Except for the title, the two dialog boxes are identical; the following information applies to both.

**Navigation Path**

You can open the Add and Edit Collector dialog boxes from the [NetFlow Page, page 52-1](#).

**Field Reference****Table 52-2** *Add and Edit Collector Dialog Boxes*

| Element   | Description                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Enter or Select the name of the device interface through which the collector is contacted.                                                    |
| Collector | Enter the IP address or the network name of the server to which NetFlow packets will be sent. You also can Select a Networks/Hosts object.    |
| UDP Port  | Specify the UDP port on the specified Collector to which NetFlow packets will be sent. Values can range from 1 to 65535; the default is 2055. |

# E-Mail Setup Page

The E-Mail Setup page (PIX 7.0/ASA Only) lets you set up a source e-mail address, as well as a list of recipients for specified syslog messages to be sent as e-mails. You can filter the syslog messages sent to a destination e-mail address by severity. The table shows which entries have been set up.

The syslog severity filter used for the destination e-mail address will be the higher of the severity selected in this section and the global filter set for all e-mail recipients in the Logging Filters page.

## Navigation Path

- (Device view) Select **Platform > Logging > Syslog > E-Mail Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > E-Mail Setup** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                   | Description                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Email Address      | Enter the email address to be used as the source address when syslogs are sent as emails.                                                                                                                                                                            |
| Destination Address table | Lists the currently defined email recipients of syslog messages.<br>Use the Add Row, Edit Row and Delete Row buttons below the table to manage this list; the Add Row and Edit Row buttons open the <a href="#">Add/Edit Email Recipient Dialog Box, page 52-3</a> . |

## Add/Edit Email Recipient Dialog Box

The Add/Edit Email Recipient dialog box lets you configure a destination address to be sent emails containing syslog messages; you can limit the messages sent according to severity.

The syslog severity filter used for the destination email address will be the higher of the severity selected in this section and the global filter set for all email recipients on the [Logging Filters Page, page 52-7](#).

## Navigation Path

You can access the Add/Edit Email Recipient dialog box from the [E-Mail Setup Page, page 52-3](#).

## Field Reference

|---------------------------|---------------------------------------------------------------------------|
| Destination Email Address | Enter the recipient email address for the chosen type of syslog messages. |

**Table 52-4 Add/Edit Email Recipient Dialog Box (Continued)**

| Element              | Description                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog Severity list | Choose the severity of the syslog messages to be emailed to this recipient; messages of the chosen severity and higher are sent. Message severity levels are described in <a href="#">Logging Levels, page 52-18</a> . |

## Event Lists Page

The Event Lists page (PIX 7.0+/ASA only) lets you define a set of syslog message filters for logging. After you enable logging and set up global logging parameters on the Logging Setup page, use this page to configure event lists used to filter syslog messages sent to different logging destinations. (The [Logging Filters Page, page 52-7](#) lets you specify logging destinations for event lists.)

Use the Add Row, Edit Row and Delete Row buttons below the Event Lists table to manage the entries. Add Row and Edit Row open the [Add/Edit Event List Dialog Box, page 52-5](#).

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Event Lists** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Event Lists** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit Event List Dialog Box

The Add/Edit Event List dialog box lets you create or edit an event list, and specify which syslog messages to include in the event list filter.

You can use the following criteria to define an event list:

- Class and Severity
- Message ID

Class represents specific types of related syslog messages. For example, the class `auth` represents all syslog messages related to user authentication.

Severity classifies syslogs based on the relative importance of the event in the normal functioning of the network. The highest severity is Emergency, which means the resource is no longer available. The lowest severity is Debugging, which provides detailed information about every network event.

The message ID is a numeric value that uniquely identifies each individual message. You can specify a single message ID, or a range of IDs, in an event list.

### Navigation Path

You can access the Add/Edit Event List dialog box from the [Event Lists Page, page 52-4](#).

## Add/Edit Syslog Class Dialog Box

The Add/Edit Syslog Class dialog box lets you specify an event class and a related severity level as an event list filter.

Class represents specific types of related syslog messages, so you do not have to select the syslogs individually. For example, the class `auth` represents all syslog messages related to user authentication.

Severity classifies syslogs based on the relative importance of the event in the normal functioning of the network. The highest severity is Emergency, which means the resource is no longer available. The lowest severity is Debugging, which provides detailed information about every network event.

### Navigation Path

## Logging Filters Page

The Logging Filters page lets you configure a logging destination for event lists (syslog filters) that have been configured using the Event Lists page, or for only the syslog messages that you specify using the Edit Logging Filters page. Syslog messages from specific or all event classes can be selected using the Edit Logging Filters page.

**Navigation Path**

- (Device view) Select **Platform > Logging > Syslog > Logging Filters** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Logging Filters** from the Policy Type selector. Right-click **Logging Filters** to create a policy, or select an existing policy from the Shared Policy selector.

|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logging Destination                 | <p>Lists the name of the logging destination to which messages matching this filter are sent. Logging destinations are as follows:</p> <ul style="list-style-type: none"> <li>• <b>Internal Buffer.</b> Messages matching this filter are published to the internal buffer of the security appliance.</li> <li>• <b>Console.</b> Messages matching this filter are published to any console port connections.</li> <li>• <b>Telnet Sessions.</b> Messages matching this filter are published to any Telnet sessions connected to the security appliance.</li> <li>• <b>Syslog Servers.</b> Messages matching this filter are published to any syslog servers specified on the <b>Platform &gt; Logging &gt; Syslog Servers</b> page.</li> <li>• <b>E-Mail.</b> Messages matching this filter are published to any recipients specified on the <b>Platform &gt; Logging &gt; E-mail Setup (PIX7.0/ASA Only)</b> page.</li> <li>• <b>SNMP Trap.</b> Messages matching this filter are published to any SNMP management stations specified on the <b>Platform &gt; Device Admin &gt; Device Access &gt; SNMP</b> page.</li> <li>• <b>ASDM.</b> Messages matching this filter are published to any ASDM sessions.</li> </ul> |
| Syslogs From All Event Classes      | <p>Lists the severity on which to filter, the event list to use, or whether logging is disabled from all event classes. Event classes are described in <a href="#">Message Classes and Associated Message ID Numbers, page 52-4</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Syslogs From Specific Event Classes | <p>Lists event class and severity set up as the filter. Event classes are described in <a href="#">Message Classes and Associated Message ID Numbers, page 52-4</a>. Severity levels are described in <a href="#">Logging Levels, page 52-18</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Edit Logging Filters Dialog Box

The Edit Logging Filters dialog box lets you edit filters for a logging destination. Syslogs can be configured from all or specific event classes, or disabled for a specific logging destination.

### Navigation Path

You can access the Edit Logging Filters dialog box from the Logging Filters page. For more information about the Logging Filters page, see [Logging Filters Page, page 52-7](#).

| Filter on severity option                          | Filters on the severity of the logging messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Filter on severity list                            | Specifies the level of logging messages on which to filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Use event list option                              | Specifies to use an event list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Use event list                                     | Specifies the event list to use. Event lists are defined on the <a href="#">Event Lists Page, page 52-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Disable logging option                             | Disables all logging to the selected destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Syslog from Specific Event Classes (PIX7.0)</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Event Class                                        | Specifies the event class and severity. Event classes include one or all available items. Event classes are described in <a href="#">Table 52-5 on page 52-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Severity                                           | Specifies the level of logging messages. Severity levels are described in <a href="#">Table 52-15 on page 52-18</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring Logging Setup

The Logging Setup page lets you enable system logging on the security appliance and configure other logging options. These options include enabling logging on the security appliance and failover unit, specifying the base log format and detail, and logging to longer-term storage devices, FTP server or Flash, before purging the internal buffer.

### Related Topics

- [Logging Setup Page, page 52-10](#)

- 
- Step 1** Select **Platform > Logging > Syslog > Logging Setup** to display the Logging Setup page.
- Step 2** Check **Enable Logging**.  
This option enables logging on the security appliance.
- Step 3** To enable logging on the failover unit paired with this security appliance, select the **Enable logging on the standby failover unit** check box.
- Step 4** To enable EMBLEM format, or to send debug messages as part of the syslog messages, select the corresponding check boxes.  
If you enable EMBLEM, you must use the UDP protocol to publish syslog messages. It is not compatible with TCP.
- Step 5** To write the internal buffer data to an FTP server for future processing prior to clearing the buffer, do the following:
- Check **FTP Server Buffer wrap**.
  - Enter the IP address of the FTP server in the **IP Address** field.
  - Enter the user name of the account used to log into the FTP server in the **User Name** field.
  - Enter the path in the **Path** field, relative to the FTP root, where the file should be stored.
  - Enter and confirm the password used to authenticate the user name.
- Step 6** To write the internal buffer data to Flash for future processing prior to clearing the buffer, do the following:
- Check **Flash**.
  - Specify the maximum amount of memory to allocate to the storage of internal buffer data.
  - Specify the minimum memory that should remain free on the Flash drive. If this minimum value cannot be retained while writing out the data from the internal buffer, the messages will be pruned to meet the space requirements.
- Step 7** To specify the maximum queue size maintained on the appliance for viewing by an ASDM client, enter that value in the **Message Queue Size (Messages)** field.
- 

## Logging Setup Page

The Logging Setup page lets you enable system logging on the security appliance and configure other logging options.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Logging Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Logging Setup** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

Table 52-10 Logging Setup Page

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Logging                                                  | Turns on logging for the main security appliance.                                                                                                                                                                                                                                                                                                                                                              |
| Enable Logging on the Failover Standby Unit                     | Turns on logging for the standby security appliance, if available.                                                                                                                                                                                                                                                                                                                                             |
| Send syslogs in EMBLEM format (PIX7.x+, ASA, FWSM 3.x+)         | Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.<br><b>Note</b> This setting is not compatible with CS-MARS.                                                                                                                                                                    |
| Send debug messages as syslogs (PIX7.x+, ASA, FWSM 3.x+)        | Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is <i>711011</i> . Default logging level for this syslog is <i>debug</i> . |
| Memory Size of Internal Buffer (bytes)                          | Specify the size of the internal buffer to which syslogs is saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 1048576.                                                                                                                                                                                                      |
| <b>Specify FTP Server Information (PIX7.x+, ASA, FWSM 3.x+)</b> |                                                                                                                                                                                                                                                                                                                                                                                                                |
| FTP Server Buffer Wrap                                          | To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.                                                                                                                                                                                         |
| IP Address                                                      | Enter the IP address of the FTP server.                                                                                                                                                                                                                                                                                                                                                                        |
| User Name                                                       | Enter the user name to use when connecting to the FTP server.                                                                                                                                                                                                                                                                                                                                                  |
| Path                                                            | Enter the path, relative to the FTP root, where the buffer contents should be saved.                                                                                                                                                                                                                                                                                                                           |
| Password/Confirm                                                | Enter and confirm the password used to authenticate the user name to the FTP server.                                                                                                                                                                                                                                                                                                                           |
| <b>Specify flash size</b>                                       |                                                                                                                                                                                                                                                                                                                                                                                                                |
| Flash                                                           | To save the buffer contents to the flash memory before it is overwritten, check this box. This option is only available in routed or transparent single mode.                                                                                                                                                                                                                                                  |
| Maximum flash to be used by logging (KB)                        | Specify the maximum space to be used in the flash memory for logging (in KB). This option is available only in routed or transparent single mode.                                                                                                                                                                                                                                                              |
| Minimum free space to be preserved (KB)                         | Specifies the minimum free space to be preserved in flash memory (in KB). This option is available only in routed or transparent single mode.                                                                                                                                                                                                                                                                  |
| <b>ASDM Logging (PIX7.x+, ASA, FWSM 3.x+)</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                |
| Message Queue Size                                              | Specify the queue size for syslogs intended for viewing in ASDM.                                                                                                                                                                                                                                                                                                                                               |

# Configuring Rate Limit Levels

The Rate Limit page lets you specify the maximum number of log messages of specific types (e.g., “alert” or “critical”), and messages with specific Syslog IDs, that can be generated within given periods of time. You can specify individual limits for each logging level, and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

The [Add/Edit Rate Limited Syslog Message Dialog Box, page 52-14](#) is used to specify the maximum number of messages that can be generated for a particular Syslog message ID within a given period of time.

The [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 52-13](#) is used to specify the maximum number of messages that can be generated for a particular Syslog logging level within a given period of time.

## Related Topics

- [Rate Limit Page, page 52-13](#)

Follow these steps to manage rate limits for message logging:

- 
- Step 1** Access the Rate Limit page by doing one of the following:
- (Device view) Select **Platform > Logging > Syslog > Rate Limit** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Rate Limit** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new policy.
- Step 2** Add, edit and delete rate limits for Syslog logging levels:
- To specify the maximum number of messages that can be generated within a given period of time for particular logging level, click the **Add Row** button under the Rate Limits for Syslog Logging Levels table to open the [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 52-13](#). Choose a logging level and define a rate limit.
  - To edit the rate limit for a particular logging level, select the appropriate entry in the Rate Limits for Syslog Logging Levels table, and then click the **Edit Row** button under the table to open the [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 52-13](#). Alter the rate limit as necessary.
  - To delete a rate limit entry from the Rate Limits for Syslog Logging Levels table, select it and then click the **Delete Row** button under the table. A confirmation dialog box may be displayed; click OK to delete the entry.
- Step 3** Add, edit and delete limits for log messages according to message IDs:
- To specify the maximum number of messages that can be generated within a given period of time for particular message ID, click the **Add Row** button under the Individually Rate Limited Syslog Messages table to open the [Add/Edit Rate Limited Syslog Message Dialog Box, page 52-14](#). Choose a Syslog message ID and define a rate limit.
  - To edit the rate limit for a particular Syslog message ID, select the appropriate entry in the Individually Rate Limited Syslog Messages table, and then click the **Edit Row** button under the table to open the [Add/Edit Rate Limited Syslog Message Dialog Box, page 52-14](#). Alter the rate limit as necessary.

- To delete a message limit entry from the Individually Rate Limited Syslog Messages table, select it and then click the **Delete Row** button under the table. A confirmation dialog box may be displayed; click OK to delete the entry.

## Rate Limit Page

The Rate Limit page allows you to specify the maximum number of log messages of a particular type (for example, alert or critical) that should be generated within a given period of time. You can specify a limit for each logging level and Syslog message ID. If the settings differ, Syslog message ID limits take precedence.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Rate Limit** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Rate Limit** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new policy.

| Syslog ID                                              | Identification number of the Syslog message for which you are specifying a rate limit. |
| No. of Messages                                        | Maximum number of messages with the specified ID allowed in the specified time period. |
| Interval (seconds)                                     | Number of seconds before the rate limit counter resets.                                |

## Add/Edit Rate Limit for Syslog Logging Levels Dialog Box

Using the Add/Edit Rate Limit for Syslog Logging Levels dialog box, you can specify the maximum number of log messages for particular log level that should be generated within a given period of time. You can specify a limit for each logging level or syslog message ID (see [Add/Edit Rate Limited Syslog Message Dialog Box, page 52-14](#)). If the settings differ, the rate limited syslog message-level settings override rate limit logging level settings.

**Navigation Path**

You can access the Add/Edit Rate Limit for Syslog Logging Levels dialog box from the Rate Limit page. For more information, see [Rate Limit Page, page 52-13](#).

**Field Reference**

**Table 52-12 Add/Edit Rate Limit for Syslog Logging Levels Dialog Box**

| Element            | Description                                                                            |
|--------------------|----------------------------------------------------------------------------------------|
| Logging Level      | The syslog logging level for which you are specifying the rate limit.                  |
| Number of Messages | Maximum number of messages of the specified type allowed in the specified time period. |
| Interval (Seconds) | Number of seconds before the rate limit counter resets.                                |

**Add/Edit Rate Limited Syslog Message Dialog Box**

Using the Add/Edit Rate Limited Syslog Message dialog box you can specify the maximum number of log messages of a particular Syslog ID that can be generated within a given period of time. You can specify a limit for each syslog message ID or logging level (see [Add/Edit Rate Limit for Syslog Logging Levels Dialog Box, page 52-13](#)). If the settings differ, the rate limited syslog message-level settings override rate limit logging level settings.

**Navigation Path**

You can access the Add/Edit Rate Limited Syslog Message dialog box from the Rate Limit page. For more information, see [Rate Limit Page, page 52-13](#).

| Element            | Description                                                                            |
|--------------------|----------------------------------------------------------------------------------------|
| Syslog ID          | Identification number of the syslog message for which you are specifying a rate limit. |
| Number of Messages | Maximum number of messages with the specified ID allowed in the specified time period. |
| Interval (Seconds) | Number of seconds before the rate limit counter resets.                                |

# Configuring Syslog Server Setup

You can configure general syslog server settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

## Related Topics

- [Defining Syslog Servers, page 52-20](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Logging > Syslog > Server Setup** to open the [Server Setup Page, page 52-16](#).
  - (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Server Setup** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Change the basic message configuration as required:
- If your syslog server expects a different facility than the default, select the required facility in the **Facility** list.
  - If you want to include the date and time a message was generated in the message, select **Enable Timestamp on Each Syslog Message**.
  - If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), select **Enable Syslog Device ID** and then select the type of ID:
- 

**Note** For an ASA cluster, each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID (Cluster ID option), syslog messages look as if they come from different units. You can also specify whether or not the interface IP address of the cluster Master should be used for all cluster devices.
- **Interface**—To use the IP address of the specified interface, regardless of the interface through which the appliance sends the message. Click **Select** to select the interface or the interface role that identifies the interface. Interface roles must map to a single interface.  
For ASA clusters, to specify that the interface IP address of the cluster Master should be used for all cluster devices, select the corresponding option under the Interface Name field.
  - **User Defined ID**—To use a text string (up to 16 characters) of your choosing.
  - **Host Name**—To use the hostname of the device.
  - **Cluster ID**—To use the unique name in the boot configuration of an individual ASA unit in the cluster as the device ID.
- Step 3** Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can suppress (disable) the generation of a message.

- To add a rule, click the **Add Row** button and fill in the [Add/Edit Syslog Message Dialog Box](#), page 52-19.

You select the message number whose configuration you want to change, and then select the new severity level, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired. Click **OK** to add the rule to the table.

For a description of message severity levels, see [Logging Levels](#), page 52-18.

- To edit a rule, select it and click the **Edit Row** button, make the desired changes, and click **OK**.
- To delete a rule, select it and click the **Delete Row** button.
- If you are using NetFlow, you can easily disable the generation of syslog messages that have NetFlow equivalents by clicking the **Disable NetFlow Equivalent Syslogs** button. This adds the messages to the table as suppressed messages. Note that if any of these syslog equivalents are already in the table, your existing rules are not overwritten.

## Server Setup Page

The Server Setup page allows you to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Server Setup** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Server Setup** from the Policy Type selector. Select an existing policy or create a new one.

| Element                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Timestamp on Each Syslog Message | Whether to include the date and time a message was generated in syslog messages. The default is to not include time stamps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Syslog Device ID                 | <p>Whether to configure a device ID in non-EMBLEM-format syslog messages. If you select this option, select one of the following to use as the device ID, which is placed at the start of all syslog messages:</p> <p><b>Note</b> For an ASA cluster, each unit in the cluster generates its own syslog messages. You can configure logging so that each unit uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all units in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all units look as if they come from a single unit. If you configure logging to use the local-unit name that is assigned in the cluster bootstrap configuration as the device ID (Cluster ID option), syslog messages look as if they come from different units. You can also specify whether or not the interface IP address of the cluster Master should be used for all cluster devices.</p> <ul style="list-style-type: none"> <li>• <b>Interface</b>—The IP address of the selected interface. Enter the name of the interface or click <b>Select</b> to select it from a list (or to select an interface role that specifies the interface). Messages include the IP address of the interface specified, regardless of which interface the adaptive security appliance uses to send the log data to the external server.<br/><br/>If you select an interface role, that role must map to a single interface on the device.<br/><br/>For ASA clusters, to specify that the interface IP address of the cluster Master should be used for all cluster devices, select the corresponding option under the Interface Name field.</li> <li>• <b>User Defined ID</b>—A text string you define as the device ID. This string can be up to 16 characters, but cannot contain any of the following special characters:<br/><br/>&amp; ' " &lt; &gt; ?</li> <li>• <b>Host Name</b>—The hostname of the security appliance.</li> <li>• <b>Cluster ID</b>—Use the unique name in the boot configuration of an individual ASA unit in the cluster as the device ID.</li> </ul> |

**Table 52-14 Server Setup Page (Continued)**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syslog Message table                      | <p>Use this table to enable or disable the generation of specific syslog messages, or to change the severity level of a message. If you do not want to constrict which message types are generated, or change any message severity levels, you do not need to configure anything in this table. The table shows the messages you have configured with the message level and whether generation is suppressed (“true” in the table).</p> <ul style="list-style-type: none"> <li>To add a rule, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Syslog Message Dialog Box, page 52-19</a>.</li> <li>To edit a rule, select it and click the <b>Edit Row</b> button.</li> <li>To delete a rule, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Disable/Enable NetFlow Equivalent Syslogs | <p>If you are using NetFlow logging, you might want to disable the generation of syslog messages that duplicate NetFlow messages. If you click the Disable button, these duplicate syslog messages are added to the Syslog Message table as suppressed messages, and the button is renamed Enable NetFlow Equivalent Syslogs.</p> <p>Clicking the Enable button removes the duplicate syslog messages from the table, meaning that they will no longer be suppressed, and the device will start sending them again. However, if you manually edited any message that was added to the list by the Disable button, the Enable button does not remove them.</p>                                                                                                                  |

## Logging Levels

The following table describes logging levels.

**Table 52-15 Logging Levels**

| Logging Level | Type          | Description                                                                                                                                      |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 0             | Emergency     | System unusable. Generates messages that identify system instabilities.                                                                          |
| 1             | Alerts        | Immediate action needed. Generates messages that identify system integrity issues that require immediate administrative action.                  |
| 2             | Critical      | Critical condition. Generates messages that identify critical system issues.                                                                     |
| 3             | Errors        | Error condition. Generates messages that identify system errors during operation.                                                                |
| 4             | Warnings      | Warning condition. Generates messages that identify system warnings. For example, device might be configured incorrectly.                        |
| 5             | Notifications | Normal but significant condition. Generates messages that identify normal operations that are typically considered significant events.           |
| 6             | Information   | Informational only. Generates messages that identify system information that is typical of day-to-day activity, such as network session records. |

**Table 52-15 Logging Levels (Continued)**

| Logging Level | Type      | Description                                                                                                                                                                                                                                                                     |
|---------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7             | Debugging | Generates syslog messages that assist you in debugging. Also generates logs that identify the commands issued during FTP sessions and the URLs requested during HTTP sessions. Includes all emergency, alert, critical, error, warning, notification, and information messages. |
| -             | Disabled  | No logging.                                                                                                                                                                                                                                                                     |

## Add/Edit Syslog Message Dialog Box

The Add/Edit Syslog Message dialog box lets you modify the logging level or suppression setting for a syslog message.

### Navigation Path

You can access the Add/Edit Syslog Message dialog box from the [Server Setup Page, page 52-16](#).

| Syslog ID list     | The message log ID of the message whose severity level or suppression setting you want to alter. These values and their corresponding messages are identified in the System Log Message guides for the appropriate product:<br><b>PIX Firewall</b><br><a href="http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html">http://www.cisco.com/en/US/products/sw/secursw/ps2120/products_system_message_guides_list.html</a><br><b>ASA</b><br><a href="http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html">http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html</a><br><b>FWSM</b><br><a href="http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html">http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/tsd_products_support_model_home.html</a> |
| Logging Level list | The logging level that you want to assign to the message. For logging levels and descriptions, see <a href="#">Logging Levels, page 52-18</a> .<br>Select (default) to use the default level assigned to the message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Suppressed         | Whether to suppress the generation of the syslog message. Suppressing a message disables its generation, so you will not see it in syslogs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# Defining Syslog Servers

The Syslog Servers page lets you specify the syslog servers to which the security appliance will send syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

## Tip

If you want to view events from an ASA device using Security Manager Event Viewer, ensure that you define the Security Manager server as a syslog server. Also, if you use CS-MARS or other applications to manage syslog events, include those servers in this policy.

By directing syslog records generated by a security appliance to a syslog server, you can process and study the records.

## Before You Begin

Enable logging. See [Configuring Logging Setup, page 52-9](#).

## Related Topics

- [Syslog Servers Page, page 52-21](#)
- [Add/Edit Syslog Server Dialog Box, page 52-22](#)

- 
- Step 1** Select **Platform > Logging > Syslog > Syslog Servers** to display the Syslog Servers page.
- Step 2** Do one of the following:
- To add a new syslog target, click the **Add Row** button.
  - To edit an existing syslog target, select the check box for the row, then click the **Edit Row** button.
- Step 3** Enter or select the interface name in the **Interface** field.
- The list displays all interfaces defined at the current scope.
- Step 4** Enter or select the IP address of the syslog server in the **IP Address** field.
- Step 5** Determine whether to use UDP or TCP, then click the appropriate radio button under Protocol.
- Step 6** Enter the port from which the security appliance sends either UDP or TCP syslog messages. The port must be the same port on which the syslog server listens.
- TCP—1470 (Default). TCP ports work only with a security appliance syslog server.
  - UDP—514 (Default).
- Step 7** To generate syslog messages using the EMBLEM format, select the **Log messages in Cisco EMBLEM format** check box.
- To enable this option, you must select UDP protocol to publish messages to this syslog server.
- Step 8** Click **OK**.
- The definition appears in the Syslog Servers table.
-

## Syslog Servers Page

The Syslog Servers page lets you specify the syslog servers to which the security appliance sends syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

### Tip

If you want to view events from an ASA device using Security Manager Event Viewer, ensure that you define the Security Manager server as a syslog server. Also, if you use CS-MARS or other applications to manage syslog events, include those servers in this policy.

### Navigation Path

- (Device view) Select **Platform > Logging > Syslog > Syslog Servers** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Logging > Syslog > Syslog Servers** from the Policy Type selector. Select an existing policy or create a new one.

| Syslog Servers table                                      | <p>The syslog servers to which this device sends syslog messages. The table shows the device interface that publishes messages to the server, the server's IP address, syslog protocol and port number, and whether the messages are in Cisco EMBLEM syslog format.</p> <p>There is a limit of four syslog servers that can be set up per context.</p> <ul style="list-style-type: none"> <li>• To add a server, click the <b>Add Row</b> button and fill in the <a href="#">Add/Edit Syslog Server Dialog Box, page 52-22</a>.</li> <li>• To edit a server, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a server, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Queue Size                                                | Specifies the size of the queue for storing syslog messages on the security appliance when syslog server is busy. Minimum is 1 message. Default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow user traffic to pass when TCP syslog server is down | Whether to restrict all traffic if any syslog server that is using the TCP protocol is down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Add/Edit Syslog Server Dialog Box

The Add/Edit Syslog Servers dialog box lets you add or edit the syslog servers to which the security appliance will send syslog messages. To make use of the syslog servers you define, you must enable logging using the Logging Setup page and set up the appropriate filters for destinations using the Logging Filters page.

### Note

There is a limit of four syslog servers that can be set up per context.

### Navigation Path

You can access the Add Syslog Servers dialog box from the Syslog Servers page. For more information about the Syslog Servers page, see [Syslog Servers Page, page 52-21](#).

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The interface used to communicate with the syslog server. Enter the name of the interface or interface role object, or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| IP Address | The IP address of syslog server. Enter the IP address or the name of the network/host policy object that defines the address, or click <b>Select</b> to select the network/host object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Protocol   | The protocol used by syslog server, either TCP or UDP. UDP is the default. TCP ports work only with a security appliance syslog server.<br><b>Note</b> You must select UDP if you intend to use the EMBLEM format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Port       | The TCP or UDP port from which the security appliance sends syslog messages and on which the syslog server receives them. The default ports for each protocol are: <ul style="list-style-type: none"> <li>• TCP—1470.</li> <li>• UDP—514.</li> </ul> <b>Tip</b> If you are defining the Security Manager server as a syslog server, you can find the port number on the Security Manager Administration <a href="#">Event Management Page, page 11-22</a> .<br><br><b>Note</b> During the installation or upgrade of Security Manager, the Common Services syslog service port is changed from 514 to 49514. Later, if Security Manager is uninstalled, the port is not reverted to 514. |

**Table 52-18 Add/Edit Syslog Server Dialog Box (Continued)**

| <b>Element</b>                                 | <b>Description</b>                                                                                                                                                                                                                         |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log messages in Cisco EMBLEM format (UDP only) | Whether to log messages in Cisco EMBLEM format. The syslog server must use UDP.<br><b>Note</b> If the syslog server is a Cisco Security MARS appliance, do not select this option. Cisco Security MARS does not process the EMBLEM format. |

## CHAPTER 53

# Configuring Multicast Policies on Firewall Devices

The Multicast section contains pages for defining IP multicast routing on security devices. Multicast routing is supported in single-context, routed mode only.

Enabling multicast routing enables IGMP and PIM on all interfaces by default. Internet Group Management Protocol (IGMP) is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. Protocol Independent Multicast (PIM) is used to maintain forwarding tables for multicast datagrams.

**Note**

Only the UDP transport layer is supported for multicast routing.

This chapter contains the following topics:

- [Enabling PIM and IGMP, page 53-1](#)
- [Configuring IGMP, page 53-2](#)
- [Configuring Multicast Routes, page 53-8](#)
- [Configuring Multicast Boundary Filters, page 53-9](#)
- [Configuring PIM, page 53-11](#)

## Enabling PIM and IGMP

The Enable PIM and IGMP page lets you enable or disable Internet Group Management Protocol (IGMP) and Protocol Independent Multicast (PIM) on all interfaces on the security appliance. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.

When **Enable PIM and IGMP** is checked on this page, PIM and IGMP are enabled on all interfaces on the security appliance. Deselect the option to disable PIM and IGMP on all interfaces.

**Note**

You can disable PIM and IGMP on a per-interface basis; see [IGMP Page - Protocol Tab, page 53-3](#) and [PIM Page - Protocol Tab, page 53-11](#) for more information.

**Navigation Path**

- (Device view) Select **Platform > Multicast > Enable PIM and IGMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Enable PIM and IGMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Configuring IGMP

Internet Protocol hosts use IGMP to report their group memberships to directly connected multicast routers. Internet Group Management Protocol (IGMP) uses group-address (Class D) IP addresses.

Host group addresses can be in the range 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

The IGMP page provides four tabbed panels, used to configure and manage IGMP in Security Manager:

- [IGMP Page - Protocol Tab, page 53-3](#) – This panel displays interface-specific IGMP parameters; you can disable IGMP and change IGMP parameters.
- [IGMP Page - Access Group Tab, page 53-5](#) – Lets you manage access groups that restrict the multicast sources allowed on an interface.
- [IGMP Page - Static Group Tab, page 53-6](#) – Sometimes, hosts on a network may have a configuration that prevents them from answering IGMP queries; however, you still want multicast traffic to be forwarded to that network segment. There are two methods to pull multicast traffic down to a network segment:
  - Use the Join Group tab to configure the interface as a member of the multicast group. With this method, the security appliance accepts the multicast packets in addition to forwarding them to the specified interface.
  - Use the Static Group tab to configure the security appliance to be a statically connected member of a group. With this method, the security appliance does not accept the packets itself, but only forwards them. Therefore, this method allows fast switching. The outgoing interface appears in the IGMP cache, but itself is not a member of the multicast group.

Use this tab to statically assign a multicast group to an interface, or change existing static group assignments.

- [IGMP Page - Join Group Tab, page 53-7](#) – Use this tab to manage the multicast groups to which the security appliance belongs.

**Note**

If you simply want to forward multicast packets for a specific group to an interface without the security appliance accepting those packets as part of the group, see [IGMP Page - Static Group Tab, page 53-6](#).

**Navigation Path**

- (Device view) Select **Platform > Multicast > IGMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > IGMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## IGMP Page - Protocol Tab

Use the Protocol tab to configure IGMP parameters for an interface on the security appliance.

**Navigation Path**

You can access the Protocol tab from the IGMP page. For more information about the IGMP page, see [Configuring IGMP, page 53-2](#).

| Interface                | The name of the interface to which the IGMP settings apply.                                                                                                                                                                                                                                                                                                                                               |
| Enabled                  | Indicates whether IGMP is enabled on the interface.                                                                                                                                                                                                                                                                                                                                                       |
| Version                  | The version of IGMP enabled on the interface.                                                                                                                                                                                                                                                                                                                                                             |
| Query Interval           | The interval, in seconds, at which the designated router sends IGMP host-query messages. Valid values range from 1 to 3600 seconds. The default value is 125 seconds.                                                                                                                                                                                                                                     |
| Query Timeout            | The period of time, in seconds, before the security appliance takes over querying the interface, after the previous appliance has stopped doing so. Valid values range from 60 to 300 seconds. The default value is 255 seconds.                                                                                                                                                                          |
| Response Time            | The maximum response time, in seconds, advertised in IGMP queries. If the security appliance does not receive any host reports within the designated response time, the IGMP group is pruned. Decreasing this value lets the security appliance prune groups faster. Valid values range from 1 to 12 seconds. The default value is 10 seconds. Changing this value is only valid only for IGMP Version 2. |
| Group Limit              | The maximum number of hosts that can join on an interface. Valid values range from 1 to 500. The default value is 500.                                                                                                                                                                                                                                                                                    |
| Maximum Groups (PIX 6.3) | The maximum number of groups enabled for multicast. Valid values range from 0 to 2000.                                                                                                                                                                                                                                                                                                                    |

**Table 53-1 Protocol Tab (Continued)**

| Element           | Description                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| Forward Interface | The name of the interface to which the selected interface forwards IGMP host reports if IGMP forwarding is enabled. |

## Configure IGMP Parameters Dialog Box

Use the Configure IGMP Parameters dialog box to configure IGMP parameters for an interface on the security appliance.

### Navigation Path

You can access the Configure IGMP Parameters dialog box from the IGMP Page - Protocol tab. For more information, see [IGMP Page - Protocol Tab, page 53-3](#).

### Related Topics

|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                   | The name of the interface to which the IGMP settings apply.                                                                                                                                                                                                                                                                                                                                          |
| Forward Interface           | The name of the interface to which IGMP host reports are forwarded if IGMP forwarding is enabled.                                                                                                                                                                                                                                                                                                    |
| Version                     | The version of IGMP to enable on the interface. Choose 1 to enable IGMP Version 1, or 2 to enable IGMP Version 2. Some features require IGMP Version 2. By default, the security appliance uses IGMP Version 2.                                                                                                                                                                                      |
| Query Interval              | The interval, in seconds, at which the designated router sends IGMP host-query messages. Valid values range from 1 to 3600 seconds. The default value is 125 seconds.                                                                                                                                                                                                                                |
| Response Time               | The maximum response time, in seconds, advertised in IGMP queries. If the security appliance does not receive any host reports within the designated response time, the IGMP group is pruned. Decreasing this value lets the security appliance prune groups faster. Valid values range from 1 to 12 seconds. The default value is 10 seconds. Changing this value is valid only for IGMP Version 2. |
| Maximum Groups (PIX 6.3)    | The maximum number of groups enabled for multicast. Valid values range from 0 to 2000.                                                                                                                                                                                                                                                                                                               |
| <b>PIX 7.x and ASA Only</b> |                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable IGMP                 | When selected, IGMP is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                           |
| Group Limit                 | The maximum number of hosts that can join on an interface. Valid values range from 1 to 500. The default value is 500.                                                                                                                                                                                                                                                                               |

**Table 53-2** *Configure IGMP Parameters Dialog Box (Continued)*

| Element       | Description                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Query Timeout | The period of time, in seconds, before the security appliance takes over querying the interface, after the previous appliance has stopped doing so. Valid values range from 60 to 300 seconds. The default value is 255 seconds. |

## IGMP Page - Access Group Tab

Use the Access Group tab to control the multicast groups that are allowed on an interface.

The table on this page lists all currently defined multicast access groups, showing for each, the name of the interface or interface role for which the group is defined, the group network(s), and whether this group is permitted or denied. For a detailed explanation of these fields, see [Configure IGMP Access Group Parameters Dialog Box, page 53-5](#).

- To add a multicast access group to the table, click the Add Row button.
- To edit the settings for a group, select it and click the Edit Row button.
- To delete a group, select it and click the Delete Row button.

### Navigation Path

You can access the Access Group tab from the [Configuring IGMP, page 53-2](#).

### Related Topics

- [Enabling PIM and IGMP, page 53-1](#)

|-------------------------|-------------------------------------------------------------------------------------|
| Interface               | The name of the interface for which you are configuring multicast group membership. |
| Multicast Group Address | The multicast group address to which this rule applies.                             |

## Configure IGMP Join Group Parameters Dialog Box

Use the Configure IGMP Join Group Parameters dialog box to configure an interface to be a member of a multicast group or to change existing membership information.

**Navigation Path**

You can access the Configure IGMP Join Group Parameters dialog box from the IGMP Page - Join Group tab. For more information, see [IGMP Page - Join Group Tab, page 53-7](#).

**Related Topics**

- [IGMP Page - Join Group Tab, page 53-7](#)
- [Configuring IGMP, page 53-2](#)

**Field Reference****Table 53-7** *Configure IGMP Join Group Parameters Dialog Box*

| Element    | Description                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------|
| Interface  | The name of the interface for which you are configuring multicast group membership.                                  |
| Join Group | The multicast group address to which this rule applies. The group address must be from 224.0.0.0 to 239.255.255.255. |

## Configuring Multicast Routes

Static multicast routes let you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them, sending the multicast packets over the tunnel.

Static multicast routes are local to the security appliance and are not advertised or redistributed.

Use the Multicast Routes page to manage static multicast routes—currently defined routes are listed, and you can add, edit and delete static multicast routes.

See [Add/Edit MRoute Configuration Dialog Box, page 53-8](#) for more information about the fields displayed in the table on this page.

**Navigation Path**

- (Device view) Select **Platform > Multicast > Multicast Routes** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Multicast Routes** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit MRoute Configuration Dialog Box

Use the Add/Edit MRoute Configuration dialog box to add a static multicast route to the security appliance, or to change an existing route.

**Navigation Path**

You can access the Add/Edit MRoute Configuration dialog box from the Multicast Routing page. See [Configuring Multicast Routes, page 53-8](#) for more information.

**Field Reference****Table 53-8 Add/Edit MRoute Configuration Dialog Box**

| Element                          | Description                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Interface                 | Enter or Select the incoming interface for the multicast route.                                                                                                                                                                                                                                                                                      |
| Source Network                   | Enter the IP address and mask of the multicast source, or select a Networks/Hosts object.                                                                                                                                                                                                                                                            |
| Output Interface/Dense           | (Optional) Enter or Select the outgoing interface for the multicast route. If you specify the destination interface, the route is forwarded through the selected interface. If you do not specify a destination interface, then RPF is used to forward the route. You can specify the interface, or the RPF neighbor, but not both at the same time. |
| Multicast Network (PIX 6.3)      | Enter or Select the group that is to receive the multicast packets. This must be a multicast IP address in the range of 224.0.1.0 to 239.255.255.255.                                                                                                                                                                                                |
| Distance (PIX 7.x, ASA and FWSM) | Enter an administrative distance for the static multicast route. If the static multicast route has the same administrative distance as the unicast route, the static multicast route takes precedence.                                                                                                                                               |

## Configuring Multicast Boundary Filters

On an ASA running version 7.2(1) or later, you can use the Multicast Boundary Filter page to configure the appliance to act as a boundary between multicast domains. The ASA compares multicast group addresses to an access list, blocking all multicast traffic except that specifically permitted by the list.

The Multicast Boundary Filter page lists all currently defined per-interface boundary filter lists; you can add, edit and delete filter lists from this page.

Refer to [Add/Edit MBoundary Configuration Dialog Box, page 53-9](#) for a description of the fields on this page.

**Navigation Path**

- (Device view) Select **Platform > Multicast > Multicast Boundary Filter** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Multicast > Multicast Boundary Filter** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action          | Choose <b>permit</b> or <b>deny</b> to specify the action taken for this multicast group.                                                                                                                                                                                                                                                                                         |
| Multicast Group | Enter a single multicast address, or a multicast group address, to which this action applies. The address must be 0.0.0.0, or from 224.0.0.0 to 239.255.255.255. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |

# Configuring PIM

Protocol independent multicast (PIM) provides a scalable method for determining the best paths in a network for distributing a specific multicast transmission to each host that has registered using IGMP to receive the transmission. Routers and security devices use PIM to maintain tables for forwarding multicast datagrams.

With PIM sparse mode (PIM SM), which is the default for Cisco routers, when the source of a multicast transmission begins broadcasting, the traffic is forwarded from one multicast router to the next until the packets reach every registered host. If a more direct path to the traffic source exists, the last-hop router sends a join message to the source that causes the traffic to be rerouted along the better path.

**Note**

PIM is not supported with PAT—the PIM protocol does not use ports and PAT only works with protocols that use ports.

When you enable multicast routing on a security appliance, PIM and IGMP are enabled on all interfaces by default. You can disable PIM on a per-interface basis.

The PIM page provides up to six tabbed panels:

- [PIM Page - Protocol Tab, page 53-11](#) – Lets you manage interface-specific PIM properties.
- [PIM Page - Neighbor Filter Tab, page 53-12](#) – Lets you manage neighbor filters for individual interfaces; available only on ASA 7.2(1)+ devices.
- [PIM Page - Bidirectional Neighbor Filter Tab, page 53-13](#) – Lets you manage bidirectional neighbor filters for individual interfaces; available only on ASA 7.2(1)+ devices.
- [PIM Page - Rendezvous Points Tab, page 53-15](#) – When you configure PIM, you must choose one or more devices to operate as the rendezvous point (RP). An RP is a single, common root of a shared distribution tree and is statically configured on each device. First-hop routers use the RP to send registration packets on behalf of the source multicast hosts.
- [PIM Page - Route Tree Tab, page 53-17](#) – By default, PIM leaf routers join the shortest-path tree immediately after the first packet arrives from a new source. This reduces delay, but requires more memory than shared tree. You can configure whether the security appliance should join shortest-path tree, or use a shared tree, either for all multicast groups or only for specific multicast addresses.
- [PIM Page - Request Filter Tab, page 53-18](#) – When the security appliance is acting as an RP, you can restrict specific multicast sources from registering. This prevents unauthorized sources from registering with the RP. The Request Filter panel lets you define the multicast sources from which the security appliance will accept PIM registration messages.

## PIM Page - Protocol Tab

Use the Protocol tab to configure PIM properties for the interfaces on a security appliance (not available on PIX 6.3 devices). All currently configured interfaces are listed; you can add, edit and delete entries on this panel.

Refer to [Add/Edit PIM Protocol Dialog Box, page 53-12](#) for a description of the fields on this panel.

**Navigation Path**

You access the Protocol tab from the PIM page. For more information, see [Configuring PIM, page 53-11](#).

**Related Topics**

- [PIM Page - Rendezvous Points Tab, page 53-15](#)
- [PIM Page - Route Tree Tab, page 53-17](#)
- [PIM Page - Request Filter Tab, page 53-18](#)

**Add/Edit PIM Protocol Dialog Box**

Use the Add/Edit PIM Protocol dialog box to configure PIM properties for an interface on a security appliance running PIX 7.x or later.

**About the Designated Router**

The DR is responsible for sending PIM register, join, and prune messages to the Rendezvous Point (RP). When there is more than one multicast routing device on a network segment, there is an election process to select the Designated Router based on DR priority. If multiple devices have the same DR priority, then the device with the highest IP address becomes the DR. By default, security appliances have a DR priority of 1.

**Navigation Path**

You can access the Add/Edit PIM Protocol dialog box from the [PIM Page - Protocol Tab, page 53-11](#).

**Field Reference**

| Element                       | Description                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                     | Enter or Select the interface on which you are configuring PIM.                                                                                                                                                                                                                                                            |
| Enable PIM                    | When checked, PIM is enabled on the selected interface. You can deselect this option to disable PIM on the interface without deleting this PIM Protocol entry from the table.                                                                                                                                              |
| DR Priority                   | The designated router (DR) priority for this interface. The router with the highest DR priority on subnet becomes the designated router. Valid values range from 0 to 4294967294. The default DR priority is 1. Setting this value to zero makes the security appliance interface ineligible to become the default router. |
| Hello Interval (seconds)      | The frequency, in seconds, at which the interface sends PIM hello messages. Valid values range from 1 to 3600 seconds; the default value is 30 seconds.                                                                                                                                                                    |
| Join-Prune Interval (seconds) | The frequency, in seconds, at which the interface sends PIM join and prune advertisements. Valid values range from 10 to 600 seconds; the default value is 60 seconds.                                                                                                                                                     |

**PIM Page - Neighbor Filter Tab**

A PIM neighbor filter is an access control list (ACL) that defines the neighbor devices that can participate in PIM. If a neighbor filter is not configured for an interface, then there are no restrictions. If a PIM neighbor filter is configured, only those neighbors permitted by the filter list can participate in PIM with the security appliance.

On an ASA running version 7.2(1) or later, you can use the Neighbor Filter tab to control the devices that can become PIM neighbors. This panel is used to define and manage the per-interface neighbor filter list. Refer to [Add/Edit PIM Neighbor Filter Dialog Box, page 53-13](#) for a description of the fields on this panel.

#### Navigation Path

You access the Protocol tab from the PIM page. For more information, see [Configuring PIM, page 53-11](#).

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface             | Enter or Select the interface to which this PIM Neighbor filter entry will be applied.                                                                                                                                                                                                                               |
| Neighbor Filter Group | Enter a single multicast address, or a multicast group address, to which the chosen Action applies. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |
| Action                | Choose <b>permit</b> to allow the specified neighbors to participate in PIM, or <b>deny</b> to prevent the specified neighbors from participating in PIM.                                                                                                                                                            |

## PIM Page - Bidirectional Neighbor Filter Tab

A PIM bidirectional neighbor filter is an access control list (ACL) that defines the neighbor devices that can participate in the bidirectional trees and designated forwarder (DF) election. If a PIM bidirectional neighbor filter is not configured for an interface, then there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in DF election process.

The PIM bidirectional neighbor filters enable the transition from a sparse-mode-only network to a “bidir” network by letting you specify the devices that should participate in DF election, while still allowing all devices to participate in the sparse-mode domain. The bidir-enabled devices can elect a DF from among themselves, even when there are non-bidir devices on the segment. Multicast boundaries on the non-bidir devices prevent PIM messages and data from the bidir groups from leaking in or out of the bidir subset cloud.

Bidirectional PIM allows multicast devices to maintain reduced state information. All of the multicast devices in a segment must be bidirectionally enabled for bidir to elect a DF.

When a PIM bidirectional neighbor filter is enabled, the routers and other devices that are permitted by the ACL are considered to be bidir-capable. Therefore:

- If a permitted neighbor does not support bidir, the DF election does not occur.
- If a denied neighbor supports bidir, then DF election does not occur.
- If a denied neighbor does not support bidir, the DF election can occur.

### Managing the Bidirectional Neighbor Filter List

On an ASA running version 7.2(1) or later, you can use this panel to define and manage the per-interface bidirectional neighbor filter list, permitting or denying multicast source addresses for specific interfaces. Refer to [Add/Edit PIM Bidirectional Neighbor Filter Dialog Box, page 53-14](#) for a description of the fields on this panel.

### Navigation Path

You access the Bidirectional Neighbor Filter tab from the PIM page. For more information, see [Configuring PIM, page 53-11](#).

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor Filter Group | Enter a single multicast address, or a multicast group address, to which the chosen Action applies. A group address range can be entered using either a standard subnet mask (e.g., 239.0.0.0 255.0.0.0), or using CIDR prefix notation (e.g., 239.0.0.0/8).<br><br>You also can Select a named network/host object. |
| Action                | Choose <b>permit</b> to allow the specified neighbors to participate in the DF election process, or <b>deny</b> to prevent the specified neighbors from participating in the process.                                                                                                                                |

## PIM Page - Rendezvous Points Tab

When you configure PIM, you must choose one or more routers or routing devices to operate as the RP. An RP is a single, common root of a shared distribution tree and is statically configured on each device. First hop routers use the RP to send register packets on behalf of the source multicast hosts.

You can configure a single RP to serve more than one group. If a specific group is not specified, the RP for the group is applied to the entire IP multicast group range (224.0.0.0/4).

Use the Rendezvous Points panel to define rendezvous points. You can configure more than one RP, but you cannot have more than one entry with the same RP.

### Navigation Path

You access the Rendezvous Points tab from the PIM page. For more information, see [Configuring PIM, page 53-11](#).

### Related Topics

- [PIM Page - Route Tree Tab, page 53-17](#)
- [PIM Page - Request Filter Tab, page 53-18](#)

### Field Reference

**Table 53-14 Rendezvous Points Tab**

| Element                                         | Description                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Generate older IOS compatible register messages | Check this box if your rendezvous point is a Cisco IOS router. The security appliance software accepts register messages with the checksum calculated on the PIM header and only the next 4 bytes, while Cisco IOS software accepts register messages with the checksum calculated on the entire PIM message for all PIM message types. |
| Rendezvous Points table                         | Lists the rendezvous points currently configured on the security appliance. Use the Add Row, Edit Row and Delete Row buttons to manage this list; the Add Row and Edit Row buttons open the <a href="#">Add/Edit Rendezvous Point Dialog Box, page 53-16</a> .                                                                          |

## Add/Edit Rendezvous Point Dialog Box

Use the Add/Edit Rendezvous Point dialog box to add an entry to the Rendezvous Points table, or to edit an existing rendezvous point entry. Please note the following:

- You cannot use the same rendezvous point address twice.
- You cannot specify “All Groups” for more than one rendezvous point.

### Navigation Path

You can access the Add/Edit Rendezvous Point dialog box from the [PIM Page - Rendezvous Points Tab, page 53-15](#).

### Field Reference

**Table 53-15 Add/Edit Rendezvous Point Dialog Box**

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rendezvous Point IP Address                             | Enter the IP address of the rendezvous point. This is a unicast address. You also can click Select to select a Networks/Hosts object.<br><br>When editing a rendezvous point entry, you cannot change this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Use bi-directional forwarding                           | Check this box if you want the specified Multicast Groups to operate in bidirectional mode. In bidirectional mode, if the security appliance receives a multicast packet and has no directly connected members or PIM neighbors present, it sends a Prune message back to the source. Deselect this option if you want the specified Multicast Groups to operate in Sparse Mode.<br><br><b>Note</b> The security appliance always advertises bidirectional capability in PIM hello messages regardless of the actual bidir configuration.                                                                                                                                                    |
| Use this RP for All Multicast Groups                    | Select this option to use the specified Rendezvous Point for all multicast groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Use this RP for the Multicast Groups as specified below | Select this option to define the multicast groups that are to use the specified Rendezvous Point; the Multicast Groups table is activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Multicast Groups table                                  | The multicast groups currently associated with the specified Rendezvous Point are listed.<br><br>Table entries are processed from the top down. For example, you can create an entry that includes a range of multicast groups, and then exclude specific groups within that range by placing deny rules for those specific groups at the top of the table. That is, the permit rule for the range of multicast groups follows the individual deny statements.<br><br>Use the buttons at the bottom of the table to open the <a href="#">Add/Edit Multicast Group Rules Dialog Box, page 53-17</a> to add or edit an entry; to delete an entry; and to move entries up or down in the table. |

## Add/Edit Multicast Group Rules Dialog Box

Use the Add/Edit Multicast Group Rules dialog box to create a multicast group rule, or modify a multicast group rule, for the Multicast Groups table in the Add/Edit Rendezvous Point dialog box. This dialog box is also used to specify individual multicast groups that use Shared Tree route filtering on the Route Tree tab

### Navigation Path

When defining Rendezvous Points, you access the Add/Edit Multicast Group Rules dialog box from the [Add/Edit Rendezvous Point Dialog Box, page 53-16](#). See [PIM Page - Rendezvous Points Tab, page 53-15](#) for more information.

When specifying how PIM register messages are filtered, you open this dialog box by clicking Add Row or Edit row buttons below the Multicast Groups table on the [PIM Page - Route Tree Tab, page 53-17](#).

### Field Reference

| Multicast Group Network | Enter the multicast address and network mask associated with the group, or Select the desired Networks/Hosts object.                                                                |

## PIM Page - Route Tree Tab

If the security appliance is acting as a Rendezvous Point, use the Route Tree tab to specify how the PIM register messages from various sources are filtered: shortest-path tree or shared tree, either for all multicast groups or only for specific multicast addresses.

### Navigation Path

You can access the Route Tree tab from the PIM page. For more information, see [Configuring PIM, page 53-11](#).

## PIM Page - Request Filter Tab

When the security appliance acts as a rendezvous point, you can restrict specific multicast sources from registering with it. This prevents unauthorized sources from registering with the rendezvous point. You can use the Request Filter tab to define the multicast sources from which the security appliance accepts and denies PIM register messages.

### Navigation Path

You can access the Request Filter tab from the PIM page. For more information, see [Configuring PIM, page 53-11](#).

| Destination Network | Enter the IP address and network mask for the multicast destination, or Select the appropriate Networks/Hosts object.                                                                                                                                                              |

## CHAPTER 54

# Configuring Routing Policies on Firewall Devices

---

The Routing section in Security Manager contains pages for defining and managing routing settings for security appliances.

This chapter contains the following topics:

- [Configuring No Proxy ARP, page 54-1](#)
- [Configuring OSPF, page 54-2](#)
- [Configuring OSPFv3, page 54-22](#)
- [Configuring RIP, page 54-40](#)
- [Configuring Static Routes, page 54-48](#)

## Configuring No Proxy ARP

When a host sends IP traffic to another device on the same Ethernet network, the host needs to know the MAC address of the device. Address Resolution Protocol (ARP) is a Layer 2 protocol that resolves an IP address to a MAC address: a host sends an ARP request asking “Who is this IP address?” The device owning the IP address replies, “I own that IP address; here is my MAC address.”

With Proxy ARP, a device responds to an ARP request with its own MAC address, even though the device does not own the IP address. Serving as an ARP Proxy for another host effectively directs network traffic to the proxy, in this case your security appliance. Traffic that passes through the appliance is then routed to the appropriate destination.

For example, the security appliance uses proxy ARP when you configure NAT and specify a global address that is on the same network as the appliance interface. The only way traffic can reach the destination hosts is if the appliance claims and subsequently routes traffic to the destination global addresses.

By default, proxy ARP is enabled for all interfaces. Use the No Proxy ARP page to disable proxy ARP for global addresses:

- To disable proxy ARP for one or more interfaces, enter their names in the Interfaces field. Separate multiple interfaces with commas. You can click Select to choose the interfaces from a list of interfaces defined on the device, and interface roles defined in Security Manager.

### Note

On ASA 8.4.2 and later devices operating in routed mode, you can disable Proxy ARP on the egress interface for a Manual NAT rule. See **Do not proxy ARP on Destination Interface** in [Add and Edit NAT Rule Dialog Boxes, page 23-35](#) for more information.

---

**Navigation Path**

- (Device view) Select **Platform > Routing > No Proxy ARP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > No Proxy ARP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Related Topics**

- [Configuring Static Routes, page 54-48](#)
- [Configuring RIP, page 54-40](#)
- [Configuring OSPF, page 54-2](#)

## Configuring OSPF

The OSPF page provides nine tabbed panels for configuring OSPF (Open Shortest Path First) routing on a firewall device. The following topics provide detailed information about enabling and configuring OSPF:

- [About OSPF, page 54-2](#)
- [General Tab, page 54-3](#)
- [Area Tab, page 54-6](#)
- [Range Tab, page 54-8](#)
- [Neighbors Tab, page 54-10](#)
- [Redistribution Tab, page 54-11](#)
- [Virtual Link Tab, page 54-13](#)
- [Filtering Tab, page 54-15](#)
- [Summary Address Tab, page 54-17](#)
- [Interface Tab, page 54-18](#)

**Navigation Path**

- (Device view) Select **Platform > Routing > OSPF** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPF** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## About OSPF

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements (LSAs) rather than routing table updates. Because only LSAs are exchanged, rather than entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF supports MD5 and clear-text neighbor authentication. Authentication should be used with all routing protocols whenever possible, because route redistribution between OSPF and other protocols (like RIP) can potentially be used by attackers to subvert routing information.

If NAT is used when OSPF is operating on public and private areas, and if address filtering is required, you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR type 3 LSA filtering, you can have separate private and public areas with the security appliance acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other. This lets you use NAT and OSPF together without advertising private networks.

**Note**

---

Only type 3 LSAs can be filtered. If you configure the security appliance as an ASBR in a private network, it will send type 5 LSAs describing private networks, which will be broadcast to the entire autonomous system (AS) including public areas.

---

If NAT is employed but OSPF is only running in public areas, routes to public networks can be redistributed inside the private network, either as default or type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the security appliance. Also, you should not mix public and private networks on the same security appliance interface.

- [Configuring OSPF, page 54-2](#)

## General Tab

Use the General panel on the OSPF page to enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks.

**Note**

---

You cannot enable OSPF if you have RIP enabled.

---

**Navigation Path**

You can access the General panel from the OSPF Page; see [Configuring OSPF, page 54-2](#) for more information.

**Field Reference****Table 54-1 OSPF General Tab**

| Element                                                                                                                                        | Description                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The General tab provides two identical sections; each is used to enable one OSPF process. The following options are available in each section. |                                                                                                                                                                                                                                                          |
| Enable this OSPF Process                                                                                                                       | Check this box to enable an OSPF process. You cannot enable an OSPF process if you have RIP enabled on the security appliance. Deselect this option to remove the OSPF process.                                                                          |
| OSPF Process ID                                                                                                                                | Enter a unique numeric identifier for the OSPF process. This process ID is used internally and does not need to match the OSPF process ID on any other OSPF devices. Valid values are from 1 to 65535.                                                   |
| Advanced button                                                                                                                                | Opens the <a href="#">OSPF Advanced Dialog Box, page 54-4</a> , in which you can configure additional process-related parameters, such Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings. |

**OSPF Advanced Dialog Box**

Use the OSPF Advanced dialog box to configure settings such as the Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings for an OSPF process.

**Navigation Path**

You can access the OSPF Advanced dialog box from the [General Tab, page 54-3](#).

**Field Reference****Table 54-2 OSPF Advanced Dialog Box**

| Element             | Description                                                                                                                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process        | Displays the ID of the OSPF process you are configuring. You cannot change this value in this dialog box.                                                                                                                                                                                                    |
| Router ID           | To use a fixed router ID, enter a router ID in IP address format in the Router ID field. If you leave this value blank, the highest-level IP address on the security appliance is used as the router ID.                                                                                                     |
| Ignore LSA MOSPF    | Select this option to suppress transmission of syslog messages when the security appliance receives Type 6 (MOSPF) LSA packets.                                                                                                                                                                              |
| RFC 1583 Compatible | Select this option to calculate summary route costs per RFC 1583. Deselect this option to calculate summary route costs per RFC 2328. To minimize the chance of routing loops, all OSPF devices in an OSPF routing domain should have RFC compatibility set identically. This option is selected by default. |

**Table 54-2** *OSPF Advanced Dialog Box (Continued)*

| <b>Element</b>                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adjacency Changes              | <p>These options specify the syslog messages sent when adjacency changes occur.</p> <ul style="list-style-type: none"> <li>• Log Adjacency Changes – When selected, the security appliance sends a syslog message whenever an OSPF neighbor goes up or down. This option is selected by default.</li> <li>• Log Adjacency Changes Detail – When selected, the security appliance sends a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This option is not selected by default.</li> </ul>                                                                                                                            |
| Administrative Route Distances | <p>Settings for the administrative route distances, according to the route type.</p> <ul style="list-style-type: none"> <li>• Inter Area – The administrative distance for all routes from one area to another. Valid values range from 1 to 255; the default value is 110.</li> <li>• Intra Area – The administrative distance for all routes within an area. Valid values range from 1 to 255; the default value is 110.</li> <li>• External – The administrative distance for all routes from other routing domains that are learned through redistribution. Valid values range from 1 to 255; the default value is 110.</li> </ul>                            |
| Timers (in seconds)            | <p>Settings used to configure LSA pacing and SPF calculation timers.</p> <ul style="list-style-type: none"> <li>• SPF Delay – The time between receipt of a topology change and the start of shortest path first (SPF) calculations. Valid values range from 0 to 65535; the default value is 5 seconds.</li> <li>• SPF Hold – The hold time between consecutive SPF calculations. Valid values range from 1 to 65534; the default value is 10 seconds.</li> <li>• LSA Group Pacing – The interval at which LSAs are collected into a group and refreshed, checksummed, or aged. Valid values range from 10 to 1800; the default value is 240 seconds.</li> </ul> |

**Field Reference****Table 54-3 Area Tab**

| Element        | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| OSPF Process   | The OSPF process the area applies to.                                 |
| Area ID        | The area ID.                                                          |
| Area Type      | The area type (Normal, Stub, or NSSA).                                |
| Networks       | The area networks.                                                    |
| Options        | The options, if any, set for the area type.                           |
| Authentication | The type of authentication set for the area (None, Password, or MD5). |
| Cost           | The default cost for the area.                                        |

**Add/Edit Area/Area Networks Dialog Box**

Use the Add/Edit Area/Area Networks dialog box to define area parameters, the networks contained by the area, and the OSPF process associated with the area.

**Navigation Path**

You can access the Add/Edit Area/Area Networks dialog box from the [Area Tab, page 54-6](#).

**Related Topics**

- [Configuring OSPF, page 54-2](#)

**Field Reference****Table 54-4 Add/Edit Area/Area Networks Dialog Box**

| Element          | Description                                                                                                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process     | When adding a new area, choose the OSPF process ID for the OSPF process for which the area is being added. If there is only one OSPF process enabled on the security appliance, that process is selected by default. When editing an existing area, you cannot change the OSPF process ID.                                                       |
| Area ID          | When adding a new area, enter the area ID. You can specify the area ID as either a decimal number or an IP address. Valid decimal values range from 0 to 4294967295. You cannot change the area ID when editing an existing area.                                                                                                                |
| <b>Area Type</b> |                                                                                                                                                                                                                                                                                                                                                  |
| Normal           | Choose this option to make the area a standard OSPF area. This option is selected by default when you first create an area.                                                                                                                                                                                                                      |
| Stub             | Choosing this option makes the area a stub area. Stub areas do not have any routers or areas beyond it. Stub areas prevent AS External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Type 3 and 4) from being flooded into the area by deselecting the Summary check box. |

Table 54-4 Add/Edit Area/Area Networks Dialog Box (Continued)

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary (allows sending LSAs into the stub area)          | When the area being defined is a stub area, deselecting this check box prevents LSAs from being sent into the stub area. This check box is selected by default for stub areas.                                                                                                                                                                                                                                          |
| NSSA                                                      | Choose this option to make the area a not-so-stubby area. NSSAs accept Type 7 LSAs. When you create a NSSA, you can prevent summary LSAs from being flooded into the area by deselecting the Summary check box. You can also disable route redistribution by deselecting the Redistribute check box and enabling Default Information Originate.                                                                         |
| Redistribute (imports routes to normal and NSSA areas)    | Deselect this check box to prevent routes from being imported into the NSSA. This check box is selected by default.                                                                                                                                                                                                                                                                                                     |
| Summary (allows sending LSAs into the NSSA area)          | When the area being defined is a NSSA, deselecting this check box prevents LSAs from being sent into the stub area. This check box is selected by default for NSSAs.                                                                                                                                                                                                                                                    |
| Default Information Originate (generate a Type 7 default) | Select this check box to generate a Type 7 default into the NSSA. This check box is deselected by default.                                                                                                                                                                                                                                                                                                              |
| Metric Value                                              | Specifies the OSPF metric value for the default route. Valid values range from 0 to 16777214. The default value is 1.                                                                                                                                                                                                                                                                                                   |
| Metric Type                                               | The OSPF metric type for the default route. The choices are 1 (Type 1) or 2 (Type 2). The default value is 2.                                                                                                                                                                                                                                                                                                           |
| Network                                                   | The IP address and network mask of the network or host to be added to the area. Use 0.0.0.0 with a netmask of 0.0.0.0 to create the default area. You can only use 0.0.0.0 in one area.<br><b>Tip</b> You can click <b>Select</b> to select the interfaces from a list of interface objects.                                                                                                                            |
| Authentication                                            | Contains the settings for OSPF area authentication. <ul style="list-style-type: none"> <li>• None—Choose this option to disable OSPF area authentication. This is the default setting.</li> <li>• Password—Choose this option to use a clear text password for area authentication. This option is not recommended where security is a concern.</li> <li>• MD5—Choose this option to use MD5 authentication.</li> </ul> |
| Default Cost                                              | Specify a default cost for the area. Valid values range from 0 to 65535. The default value is 1.                                                                                                                                                                                                                                                                                                                        |

## Range Tab

Use the Range tab to summarize routes between areas.

### Navigation Path

You can access the Range tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

**Related Topics**

**Field Reference****Table 54-5** *Range Tab*

| Element    | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID | The ID of the OSPF process associated with the route summary.                                                                                                                       |
| Area ID    | The ID of the area associated with the route summary.                                                                                                                               |
| Network    | The summary IP address and network mask.                                                                                                                                            |
| Advertise  | Displays “true” if the route summaries are advertised when they match the address/mask pair or “false” if the route summaries are suppressed when they match the address/mask pair. |

**Add/Edit Area Range Network Dialog Box**

Use the Add/Edit Area Range Network dialog box to add a new entry to the Route Summarization table or to change an existing entry.

**Navigation Path**

You can access the Add/Edit Area Range Network dialog box from the [Range Tab, page 54-8](#).

**Related Topics**

- [Configuring OSPF, page 54-2](#)

**Field Reference****Table 54-6** *Add/Edit Area Range Network Dialog Box*

| Element      | Description                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Select the OSPF process to which the route summary applies. You cannot change this value when editing an existing route summary entry.                                                                        |
| Area         | Select the area ID of the area to which the route summary applies. You cannot change this value when editing an existing route summary entry.                                                                 |
| Network      | The IP address and mask of the network for the routes being summarized.<br><br><b>Tip</b> You can click <b>Select</b> to select the networks from a list of network objects.                                  |
| Advertise    | Select this check box to set the address range status to “advertise”. This causes Type 3 summary LSAs to be generated. Deselect this check box to suppress the Type 3 summary LSA for the specified networks. |

## Neighbors Tab

Use the Neighbors tab to define static neighbors. You need to define a static neighbor for each point-to-point, non-broadcast interface. You also need to define a static route for each static neighbor in the Neighbors table.

### Navigation Path

You can access the Neighbors tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

### Related Topics

- [Add/Edit Static Neighbor Dialog Box, page 54-10](#)

### Field Reference

**Table 54-7**      *Neighbors Tab*

| Element      | Description                                           |
|--------------|-------------------------------------------------------|
| OSPF Process | The OSPF process associated with the static neighbor. |
| Neighbor     | The IP address of the static neighbor.                |
| Interface    | The interface associated with the static neighbor.    |

## Add/Edit Static Neighbor Dialog Box

Use the Add/Edit Static Neighbor dialog box to define a static neighbor or change information for an existing static neighbor. You must define a static neighbor for each point-to-point, non-broadcast interface.

### Navigation Path

You can access the Add/Edit Static Neighbor dialog box from the [Neighbors Tab, page 54-10](#).

### Related Topics

- [Configuring OSPF, page 54-2](#)

| Element      | Description                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | The OSPF process associated with the static neighbor.                                                                                                  |
| Neighbor     | The IP address of the static neighbor.<br><b>Tip</b> You can click <b>Select</b> to select the neighbor from a list of host objects.                   |
| Interface    | The interface associated with the static neighbor.<br><b>Tip</b> You can click <b>Select</b> to select the interface from a list of interface objects. |

## Redistribution Tab

Use the Redistribution tab to define the rules for redistributing routes from one routing domain to another.

### Navigation Path

You can access the Redistribution tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

### Related Topics

- [Redistribution Dialog Box, page 54-11](#)

### Field Reference

**Table 54-9**      *Redistribution Tab*

| Element      | Description                                                                                                                                                                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | The OSPF process associated with the route redistribution entry.                                                                                                                                                                                                                                                                                                     |
| Route Type   | The source protocol the routes are being redistributed from. Valid entries are the following: <ul style="list-style-type: none"> <li>• Static—The route is a static route.</li> <li>• Connected—The route was established automatically by virtue of having IP enabled on the interface.</li> <li>• OSPF—The route is an OSPF route from another process.</li> </ul> |
| Match        | The conditions used for redistributing routes from one routing protocol to another.                                                                                                                                                                                                                                                                                  |
| Subnets      | Displays “true” if subnetted routes are redistributed. Does not display anything if only routes that are not subnetted are redistributed.                                                                                                                                                                                                                            |
| Metric Value | The metric that is used for the route. This column is blank for redistribution entries if the default metric is used.                                                                                                                                                                                                                                                |
| Metric Type  | Displays “1” if the metric is a Type 1 external route, “2” if the metric is Type 2 external route.                                                                                                                                                                                                                                                                   |
| Tag Value    | A 32-bit decimal value attached to each external route. This value is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295.                                                                                                                                                                     |
| Route Map    | The name of the route map to apply to the redistribution entry.                                                                                                                                                                                                                                                                                                      |

## Redistribution Dialog Box

Use the Redistribution dialog box to add a redistribution rule or to edit an existing redistribution rule in the Redistribution table.

### Navigation Path

You can access the Redistribution dialog box from the [Redistribution Tab, page 54-11](#).

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Select the OSPF process associated with the route redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Route Type   | Select the source protocol from which the routes are being redistributed. You can choose one of the following options: <ul style="list-style-type: none"> <li>• Static—The route is a static route.</li> <li>• Connected—The route was established automatically by virtue of having IP enabled on the interface.</li> <li>• OSPF—The route is an OSPF route from another process.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Match        | The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions: <ul style="list-style-type: none"> <li>• Internal—The route is internal to a specific AS.</li> <li>• External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> <li>• NSSA External 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> <li>• NSSA External 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes.</li> </ul> |
| Metric Value | The metric value for the routes being redistributed. Valid values range from 1 to 16777214. When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Metric Type  | Select “1” if the metric is a Type 1 external route, “2” if the metric is a Type 2 external route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Tag Value    | The tag value is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Use Subnets  | When selected, redistribution of subnetted routes is enabled. Deselect this check box to cause only routes that are not subnetted to be redistributed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Route Map    | The name of the route map to apply to the redistribution entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Virtual Link Tab

Use the Virtual Link tab to create virtual links. If you add an area to an OSPF network, and it is not possible to connect the area directly to the backbone area, you need to create a virtual link. A virtual link connects two OSPF devices that have a common area, called the transit area. One of the OSPF devices must be connected to the backbone area.

### Navigation Path

You can access the Virtual Link tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Area ID                 | Select the area shared by the neighbor OSPF devices. The selected area cannot be an NSSA or a stub area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Peer Router             | Enter the IP address of the virtual link neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Hello Interval          | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds. The default value is 10 seconds.                                                                                                                                                                                                          |
| Retransmit Interval     | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgement message. If the router receives no acknowledgement, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                        |
| Transmit Delay          | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds. The default value is 1 second. |
| Dead Interval           | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535. The default value of this field is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                  |
| Authentication          | Contains the OSPF authentication options. <ul style="list-style-type: none"> <li>• None—Choose this option to disable OSPF authentication.</li> <li>• Password—Choose this option to use clear text password authentication. This is not recommended where security is a concern.</li> <li>• MD5—Choose this option to use MD5 authentication (recommended).</li> </ul>                                                                                                                                                                                                        |
| Authentication Password | Contains the settings for entering the password when password authentication is enabled. <ul style="list-style-type: none"> <li>• Password—Enter a text string of up to 8 characters.</li> <li>• Confirm—Re-enter the password.</li> </ul>                                                                                                                                                                                                                                                                                                                                     |

### Field Reference

**Table 54-13 Add/Edit OSPF Virtual Link MD5 Configuration Dialog Box**

| Element    | Description                                                   |
|------------|---------------------------------------------------------------|
| MD5 Key ID | A numerical key identifier. Valid values range from 1 to 255. |
| MD5 Key    | An alphanumeric character string of up to 16 bytes.           |
| Confirm    | Re-enter the MD5 key.                                         |

## Filtering Tab

Use the Filtering tab to configure the ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restricts all other prefixes. This type of area filtering can be applied out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF areas at the same time.

### Benefits

OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

### Restrictions

Only type-3 LSAs that originate from an ABR are filtered.

**Navigation Path**

You can access the Filtering tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

**Related Topics**

- [Add/Edit Filtering Dialog Box, page 54-16](#)

**Field Reference****Table 54-14 Filtering Tab**

| Element           | Description                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process      | The OSPF process associated with the filter entry.                                                                                              |
| Area ID           | The ID of the area associated with the filter entry.                                                                                            |
| Prefix List Name  | The name of the prefix list.                                                                                                                    |
| Filtered Network  | The IP address and mask of the network being filtered.                                                                                          |
| Traffic Direction | Displays “Inbound” if the filter entry applies to LSAs coming in to an OSPF area or “Outbound” if it applies to LSAs going out of an OSPF area. |
| Sequence #        | The sequence number for the filter entry. When multiple filters apply to an LSA, the filter with the lowest sequence number is used.            |
| Action            | Displays “Permit” if LSAs matching the filter are allowed or “Deny” if LSAs matching the filter are denied.                                     |
| Lower Range       | The minimum prefix length to be matched.                                                                                                        |
| Upper Range       | The maximum prefix length to be matched.                                                                                                        |

**Add/Edit Filtering Dialog Box**

Use the Add/Edit Filtering dialog box to add new filters to the Filter table or to modify an existing filter.

**Navigation Path**

You can access the Add/Edit Filtering dialog box from the [Filtering Tab, page 54-15](#).

**Related Topics**

- [Configuring OSPF, page 54-2](#)

**Field Reference****Table 54-15 Add/Edit Filtering Dialog Box**

| Element          | Description                                                  |
|------------------|--------------------------------------------------------------|
| OSPF Process     | Select the OSPF process associated with the filter entry.    |
| Area ID          | Select the ID of the area associated with the filter entry.  |
| Prefix List Name | Enter the prefix name.                                       |
| Filtered Network | Enter the IP address and mask of the network being filtered. |

**Table 54-15 Add/Edit Filtering Dialog Box (Continued)**

| Element           | Description                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Direction | Select the traffic direction to filter. Choose “Inbound” to filter LSAs coming into an OSPF area or “Outbound” to filter LSAs going out of an OSPF area.                                                                                                                                                 |
| Sequence Number   | Enter a sequence number for the filter. Valid values range from 1 to 4294967294. When multiple filters apply to an LSA, the filter with the lowest sequence number is used.                                                                                                                              |
| Action            | Select “Permit” to allow the LSA traffic or “Deny” to block the LSA traffic.                                                                                                                                                                                                                             |
| Lower Range       | Specify the minimum prefix length to be matched. The value of this setting must be greater than the length of the network mask entered in the Filtered Network field and less than or equal to the value, if present, entered in the Upper Range field.                                                  |
| Upper Range       | Enter the maximum prefix length to be matched. The value of this setting must be greater than or equal to the value, if present, entered in the Lower Range field, or, if the Lower Range field is left blank, greater than the length of the network mask length entered in the Filtered Network field. |

## Summary Address Tab

Use the Summary Address tab to configure summary addresses for each OSPF routing process.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.

### Navigation Path

You can access the Summary Address tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

| Element      | Description                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process | Choose the OSPF process associated with the summary address. You cannot change this information when editing an existing entry.                                                                             |
| Network      | The IP address and network mask of the summary address.                                                                                                                                                     |
| Tag          | The tag value is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between ASBRs. Valid values range from 0 to 4294967295. |
| Advertise    | When selected, summary routes are advertised. Deselect this check box to suppress routes that fall under the summary address. By default, this check box is selected.                                       |

## Interface Tab

Use the Interface tab to configure interface-specific OSPF authentication routing properties.

### Navigation Path

You can access the Interface tab from the OSPF page. For more information about the OSPF page, see [Configuring OSPF, page 54-2](#).

Table 54-18 Interface Tab

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface           | The name of the interface to which the configuration applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Authentication      | The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values: <ul style="list-style-type: none"> <li>• None—OSPF authentication is disabled.</li> <li>• Password—Clear text password authentication is enabled.</li> <li>• MD5—MD5 authentication is enabled.</li> <li>• Area—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> </ul> |
| Point-to-Point      | Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Cost                | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Priority            | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MTU Ignore          | Displays “false” if MTU mismatch detection is enabled. Displays “true” if the MTU mismatch detection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Database Filter     | Displays “true” if outgoing LSAs are filtered during synchronization and flooding. Displays “false” if filtering is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Hello Interval      | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds. The default value is 10 seconds.                                                                                                                                                                                                                                                                                                            |
| Transmit Delay      | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds. The default value is 1 second.                                                                                                   |
| Retransmit Interval | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgement message. If the router receives no acknowledgement, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                                                                                                                              |

**Table 54-18** *Interface Tab (Continued)*

| Element       | Description                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dead Interval | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535. The default value of this setting is four times the interval set by the Hello Interval field. |

## Add/Edit Interface Dialog Box

Use the Add/Edit Interface dialog box to add OSPF authentication routing properties for an interface or to change an existing entry.

### Navigation Path

You can access the Add/Edit Interface dialog box from the [Interface Tab, page 54-18](#).

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface               | The name of the interface to which the configuration applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Authentication          | The type of OSPF authentication enabled on the interface. The authentication type can be one of the following values: <ul style="list-style-type: none"> <li>• No Authentication—OSPF authentication is disabled.</li> <li>• Area Authentication—The authentication type specified for the area is enabled on the interface. Area authentication is the default value for interfaces. However, area authentication is disabled by default. So, unless you previously specified an area authentication type, interfaces showing Area authentication have authentication disabled.</li> <li>• Password Authentication—Clear text password authentication is enabled.</li> <li>• MD5 Authentication—MD5 authentication is enabled.</li> </ul> |
| Authentication Password | Contains the settings for entering the password when password authentication is enabled. <ul style="list-style-type: none"> <li>• Enter Password—Enter a text string of up to 8 characters.</li> <li>• Confirm—Re-enter the password.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 54-19 Add/Edit Interface Dialog Box (Continued)**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD5 Key IDs and Keys      | <p>Contains the settings for entering the MD5 keys and parameters when MD5 authentication is enabled. All devices on the interface using OSPF authentication must use the same MD5 key and ID.</p> <ul style="list-style-type: none"> <li>• Key ID—Enter a numerical key identifier. Valid values range from 1 to 255.</li> <li>• Key—An alphanumeric character string of up to 16 bytes.</li> <li>• Confirm—Re-enter the MD5 key.</li> </ul>                                                                                                                                  |
| Cost                      | The cost of sending a packet through the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Priority                  | The OSPF priority assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MTU Ignore                | When selected, MTU mismatch detection is disabled. Deselect this check box to enable MTU mismatch detection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Database Filter All Out   | When selected, outgoing LSAs are filtered during synchronization and flooding. Deselect this check box to disable filtering.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Hello Interval (sec)      | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 65535 seconds. The default value is 10 seconds.                                                                                                                                                                                                          |
| Transmit Delay (sec)      | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds. The default value is 1 second. |
| Retransmit Interval (sec) | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds. The default value is 5 seconds.                                                                          |
| Dead Interval (sec)       | The interval, in seconds, in which no hello packets are received, causing neighbors to declare a router down. Valid values range from 1 to 65535. The default value of this setting is four times the interval set by the Hello Interval field.                                                                                                                                                                                                                                                                                                                                |
| Point-to-Point            | Displays “true” if the interface is set to non-broadcast (point-to-point). Displays “false” if the interface is set to broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# Configuring OSPFv3

The OSPFv3 page provides two tabbed panels for configuring OSPF (Open Shortest Path First) version 3 routing on a firewall device.

## Navigation Path

- (Device view) Select **Platform > Routing > OSPFv3** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPFv3** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

This is the basic procedure for configuring an OSPFv3 process and assigning it to an interface on the OSPFv3 page:

1. On the [Process Tab](#), page 54-24:
  - Specify which of the two processes you are configuring by choosing **Process 1** or **Process 2** from the OSPFv3 Process drop-down list.
  - Check **Enable OSPFv3 Process**.
  - Assign a **Process ID**; any positive integer between 1 and 65535.
  - Use the following features as needed to define the process:
    - **Advanced** button, opening the [OSPFv3 Advanced Properties Dialog Box](#), page 54-25.
    - [Area Tab \(OSPFv3\)](#), page 54-28, for managing area, range, and virtual-link definitions, by means of the [Add/Edit Area Dialog Box \(OSPFv3\)](#), page 54-29, [Add/Edit Range Dialog Box \(OSPFv3\)](#), page 54-30, and [Add/Edit Virtual Link Dialog Box \(OSPFv3\)](#), page 54-31.
    - **Redistribution** panel, for managing route redistribution definitions by means of the [Add/Edit Redistribution Dialog Box \(OSPFv3\)](#), page 54-32.
    - **Summary Prefix** panel, for managing summary-prefix definitions by means of the [Add/Edit Summary Prefix Dialog Box \(OSPFv3\)](#), page 54-34.
2. On the [OSPFv3 Interface Tab](#), page 54-34:
  - a. Use the Interface and Neighbor panels to assign the process to a specific interface, using the [Add/Edit Interface Dialog Box \(OSPFv3\)](#), page 54-35 and the [Add/Edit Neighbor Dialog Box \(OSPFv3\)](#), page 54-38.

## About OSPFv3

Open Shortest Path First (OSPF) is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. Version 3 is basically OSPFv2 enhanced for IPv6. It is similar to OSPFv2 (see [About OSPF](#), page 54-2), but it is not backward compatible. To use OSPF to route both IPv4 and IPv6v packets, it will be necessary to run both OSPFv2 and OSPFv3 concurrently. They co-exist with each other, but do not interact.

### Note

OSPFv3 is supported on ASA 9.0+ devices operating in single-context, routed mode only. That is, multiple contexts and transparent mode are not supported.

Think of a link as being an interface on a networking device. A link-state protocol makes its routing decisions based on the states of the links that connect source and destination devices. The state of a link is a description of that interface and its relationship to its neighboring networking devices. This interface information includes the IPv6 prefix/length of the interface, the type of network it is connected to, the devices connected to that network, and so on. This information is propagated in various type of link-state advertisements (LSAs). Because only LSAs are exchanged, rather than entire routing tables, OSPF networks converge more quickly than RIP networks.

The ASA can run two processes of the OSPFv3 protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to co-exist, but OSPFv3 does not allow overlapping addresses). Or you might want to run one process on the inside interface and another on the outside, redistributing a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPFv3 routing process from another OSPFv3 routing process, a RIP routing process, or from static and connected routes configured on OSPFv3-enabled interfaces.

If NAT is employed but OSPFv3 is only running in public areas, routes to public networks can be redistributed inside the private network, either as default or type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the security appliance. Also, you should not mix public and private networks on the same security appliance interface.

### Differences Between OSPFv2 and OSPFv3

The additional features provided by OSPFv3 over OSPFv2 include the following:

- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Authentication support using the IPsec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

### Configuration Restrictions

The following are ASA OSPFv3 configuration restrictions:

- To enable OSPFv3 on a specific interface, IPv6 should be enabled on the interface and it must be named.
- Only one OSPFv3 process, with one area and one instance, can be assigned to an interface.
- The Interface neighbor entries take effect only when the OSPFv3 is enabled, and network type should be point-to-point on the specified interface.
- Interface neighbor address must be a link-local address.
- Range value in area Range table should be unique across the area.
- If the area is set to NSSA or stub, the same area cannot be set for virtual-link.
- OSPFv3 redistribution not applicable on the same OSPFv3 process.

- If used in an ASA cluster, OSPFv3 encryption should be disabled.
- The Layer 3 cluster pool is not shared between OSPFv3 and the interface.

## Process Tab

Use the Process tab on the OSPFv3 page to enable and configure up to two OSPFv3 routing processes. Each OSPF process has its own associated areas and networks. For each, at minimum, create an area for OSPFv3, enable an interface for OSPFv3, then redistribute the route into the targeted OSPFv3 routing processes. Note that only single-context mode is supported.

#### Navigation Path

The Process tab is on the OSPFv3 page.

- (Device view) Select **Platform > Routing > OSPFv3** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > OSPFv3** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Area           | Use the tabs and tables in this panel to manage area, range and virtual-link definitions. See <a href="#">Area Tab (OSPFv3), page 54-28</a> for more about these definitions. |
| Redistribution | Use this panel to manage redistribution definitions. See <a href="#">Add/Edit Redistribution Dialog Box (OSPFv3), page 54-32</a> for more about these definitions.            |
| Summary Prefix | Use this panel to manage summary prefix definitions. See <a href="#">Add/Edit Summary Prefix Dialog Box (OSPFv3), page 54-34</a> for more about these definitions.            |

## OSPFv3 Advanced Properties Dialog Box

Use the OSPF Advanced dialog box to configure settings such as the Router ID, Adjacency Changes, Administrative Route Distances, Timers, and Default Information Originate settings for an OSPF process.

### Navigation Path

You can access the OSPF Advanced dialog box from the [Process Tab, page 54-24](#).

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPF Process     | This read-only field displays the ID of the OSPF process you are configuring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Router ID        | On a single device, choose <b>Automatic</b> or <b>IP Address</b> . (An address field appears when you choose IP Address.)<br><br>If you choose Automatic, the highest-level IP address on the security appliance is used as the router ID. To use a fixed router ID, choose IP Address and enter an IPv4 address in the Router ID field.<br><br>On a device cluster, choose <b>Automatic</b> or <b>Cluster Pool</b> . (An IPv4 Pool object ID field appears when you choose Cluster Pool.)<br><br>If you choose Cluster Pool, enter or Select the name of the IPv4 Pool object that is to supply the Router ID address. For more information, see <a href="#">Add or Edit IPv4 Pool Dialog Box, page 6-83</a> . |
| Ignore LSA MOSPF | Select this option to suppress transmission of syslog messages when the security appliance receives Type 6 (MOSPF) LSA packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 54-21 OSPF Advanced Dialog Box (Continued)**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adjacency Changes              | <p>These options specify the syslog messages sent when adjacency changes occur:</p> <ul style="list-style-type: none"> <li>• Log Adjacency Changes – When selected, the security appliance sends a syslog message whenever an OSPF neighbor goes up or down. Checking this box enables the Include Details option.</li> <li>• Include Details – When selected, the security appliance sends a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This option is available only when Log Adjacency Changes is checked.</li> </ul>                                                               |
| Administrative Route Distances | <p>Settings for the administrative route distances, according to the route type.</p> <ul style="list-style-type: none"> <li>• Inter Area – The administrative distance for all routes from one area to another. Valid values range from 1 to 254; the default value is 110.</li> <li>• Intra Area – The administrative distance for all routes within an area. Valid values range from 1 to 254; the default value is 110.</li> <li>• External – The administrative distance for all routes from other routing domains that are learned through redistribution. Valid values range from 1 to 254; the default value is 110.</li> </ul> |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timers (in milliseconds) | <p>LSA and SPF throttling provide a dynamic mechanism to slow LSA updates in OSPFv3 during times of network instability, and allow faster OSPFv3 convergence by providing LSA rate limiting. The settings used to configure LSA pacing and SPF calculation timers are:</p> <ul style="list-style-type: none"> <li>• LSA Arrival – The minimum delay between acceptance of the same LSA arriving from neighbors. Valid values range from 0 to 6000000 milliseconds. The default is 1000.</li> <li>• LSA Flood Pacing – The amount of time LSAs in the flooding queue are paced in between updates. Valid values range from 5 to 100 milliseconds. The default value is 33.</li> <li>• LSA Group Pacing – The interval at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800; the default value is 240 milliseconds.</li> <li>• LSA Retransmission Pacing – The length of time at which LSAs in the retransmission queue are paced. Valid values range from 5 to 200 milliseconds. The default value is 66.</li> <li>• LSA Throttle – The delay in milliseconds to generate the first occurrence of the LSA. Valid values range from 0 to 600000 milliseconds. When you enter a value in this field, the min and max fields are enabled: <ul style="list-style-type: none"> <li>– min – The minimum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> <li>– max – The maximum delay for originating the same LSA. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> <li>• SPF Throttle – The delay to receive a change to the SPF calculation. Valid values range from 1 to 600000 milliseconds. When you enter a value in this field, the min and max fields are enabled: <ul style="list-style-type: none"> <li>– min – The delay between the first and second SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> <li>– max – The maximum wait time for SPF calculations. Valid values range from 1 to 600000 milliseconds.</li> </ul> </li> </ul> <p><b>Note</b> Note For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.</p> |

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Information Originate | <p>Settings used by an ASBR to generate a default external route into an OSPFv3 routing domain:</p> <ul style="list-style-type: none"> <li>• Enable Default Information Originate – Check this box to enable generation of a default route into the OSPFv3 routing domain; the following options become available: <ul style="list-style-type: none"> <li>– Always advertise the default route – Check this box to always advertise the default route.</li> <li>– Metric Value – The OSPFv3 metric used to generate the default route. Valid values range from 0 to 16777214.</li> <li>– Metric Type – The external link type associated with the default route advertised into the OSPFv3 routing domain. Choose <b>1</b> or <b>2</b>, indicating a Type 1 or a Type 2 external route. The default value is 1.</li> <li>– Route Map – (Optional) The name of a route map to apply. The routing process generates the default route if the route map is satisfied.</li> </ul> </li> </ul> <p><b>Note</b> This field contains only the Route Map name. The Route Map is created and contained within a FlexConfig; see <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.</p> |
| Passive Interface             | <p>Passive routing helps control the advertisement of OSPFv3 routing information, and disables sending and receiving OSPFv3 routing updates on an interface.</p> <p>Enter or Select one or more interfaces, or interface objects, to enable passive OSPFv3 routing on those interfaces. IPv4 and IPv6 addresses are supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Area Tab (OSPFv3)

Use the Area panel on the [Process Tab, page 54-24](#) of the OSPFv3 page to configure OSPFv3 areas, ranges and virtual links. The Area panel consists of three definition tables—Area, Range, and Virtual Link:

- Refer to [Add/Edit Area Dialog Box \(OSPFv3\), page 54-29](#) for information about adding and editing Area table entries.
- Refer to [Add/Edit Range Dialog Box \(OSPFv3\), page 54-30](#) for information about adding and editing Range table entries.
- Refer to [Add/Edit Virtual Link Dialog Box \(OSPFv3\), page 54-31](#) for information about adding and editing Virtual Link table entries.

Refer to [Using Tables, page 1-45](#) for basic information about working with Security Manager tables.

### Navigation Path

You can access the Area tab from the [Process Tab, page 54-24](#) of the OSPFv3 page. For more information about the OSPFv3 page, see [Configuring OSPFv3, page 54-22](#).

**Related Topics**

- [About OSPFv3, page 54-22](#)

**Table 54-22 Add/Edit Area Dialog Box**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Area ID | Enter an identifier for the area as either a decimal number or an IP address. Valid decimal values range from 0 to 4294967295.                                                                                                                                                                                                                                                                   |
| Cost    | The cost of sending a packet on an interface. Valid values are 0 to 65535.<br><br>Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The ASA calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths. |

|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                                                                                                                                | <p>Define the area type by choosing one of the following:</p> <ul style="list-style-type: none"> <li>• Normal – Make the area a standard OSPFv3 area. This option is selected by default when you first create an area.</li> <li>• NSSA – Make the area a “not-so-stubby area.” NSSAs accept Type 7 LSAs. When you choose this option, the Default Information Originate options are enabled.</li> </ul> <p>When you create a NSSA, you can prevent summary LSAs from being flooded into the area by deselecting <i>Allow sending summary LSA into this area</i>. You can also disable route redistribution by deselecting <i>Redistribute</i>, and enabling <i>Default information originate</i>.</p> <ul style="list-style-type: none"> <li>• Stub – Make the area a stub area. Stub areas do not have any routers or areas beyond it. Stub areas prevent AS External LSAs (Type 5 LSAs) from being flooded into the stub area. When you choose this option, <i>Allow sending summary LSA into this area</i> is enabled.</li> </ul> <p>When you create a stub area, you can prevent summary LSAs (Type 3 and 4) from being flooded into the area by deselecting <i>Allow sending summary LSA into this area</i>.</p> |
| <b>Default Information Originate</b>                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| These options are enabled when you choose NSSA as the area Type. The first option is enabled when you choose Stub as the area Type. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Allow sending summary LSA into this area                                                                                            | Select to allow flooding of summary LSAs into the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Redistribute (imports routes to normal and NSSA areas)                                                                              | Select to allow route redistribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Default information originate                                                                                                       | <p>Check this box to generate a Type 7 default into the NSSA. Selecting this option enables the following metric options:</p> <ul style="list-style-type: none"> <li>• Metric – The OSPF metric value for the default route. Valid values range from 1 to 16777214. The default is 1.</li> <li>• Metric Type – The OSPF metric type for the default route. Choose 1 (Type 1) or 2 (Type 2). The default is 1.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Add/Edit Range Dialog Box (OSPFv3)**

Use the Add/Edit Area Range Network dialog box to add a new range to the area selected in the Area table, or to change an existing entry.

**Navigation Path**

You can access the Add/Edit Range dialog box from the Range panel under the [Area Tab \(OSPFv3\)](#), [page 54-28](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Area ID            | This read-only entry is the ID of the area to which this range applies.                                                                                                                                                                                                                                                                                                                                                                                                              |
| IPv6 Prefix/Length | The IPv6 address(es) for the routes being summarized.<br><b>Tip</b> You can click <b>Select</b> to select the networks from a list of network objects.                                                                                                                                                                                                                                                                                                                               |
| Cost               | The cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values are 0 to 16777215.<br><br>Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The ASA calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths. |
| Advertise          | Select this option to set the address range status to advertise. This causes Type 3 summary LSAs to be generated (this is the default). Deselect this option to suppress the Type 3 summary LSAs for the specified networks.                                                                                                                                                                                                                                                         |

### Add/Edit Virtual Link Dialog Box (OSPFv3)

Use the Add/Edit Virtual Link dialog box to define virtual links for the area selected in the Area table, or change the properties of existing virtual links.

#### Navigation Path

You can access the Add/Edit Virtual Link dialog box from the Virtual Link panel under the [Area Tab \(OSPFv3\), page 54-28](#).

| Peer Router ID    | Enter the IP address of the virtual link neighbor.<br><b>Tip</b> You can click <b>Select</b> to select from a list of network objects.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TTL Security      | The time-to-live (TTL) security hop count on a virtual link. The hop count value can range from 1 to 254.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Dead Interval     | The interval, in seconds, if no hello packets are received, neighbors declare the device down. Valid values range from 1 to 8192. The default value of this field is four times the Hello Interval.                                                                                                                                                                                                                                                                                                                                                                           |
| Hello Interval    | The interval, in seconds, between hello packets sent on an interface. The smaller the hello interval, the faster topological changes are detected but the more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface. Valid values range from 1 to 8192 seconds. The default value is 10 seconds.                                                                                                                                                                                                          |
| Transmit Interval | The time, in seconds, between LSA retransmissions for adjacencies belonging to the interface. When a device sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the device does not receive an acknowledgment, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 8192 seconds. The default value is 5 seconds.                                                                  |
| Transmit Delay    | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 8192 seconds. The default value is 1 second. |

## Add/Edit Redistribution Dialog Box (OSPFv3)

Use the Add/Edit Redistribution dialog box to add a redistribution rule to this process, or to edit an existing redistribution rule.

### Navigation Path

You can access the Redistribution dialog box from the Redistribution panel under the [Process Tab](#), [page 54-24](#).

## Field Reference

Table 54-25 Add/Edit Redistribution Dialog Box

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Protocol   | <p>Choose the source protocol for route redistribution:</p> <ul style="list-style-type: none"> <li>• Connected – Redistributes connected routes (routes established automatically by virtue of having an IP address enabled on the interface) to the OSPFv3 routing process. Connected routes are redistributed as external to the autonomous system.</li> <li>• OSPF – Redistributes routes from another OSPF routing process. The Routing PID and the Match options are enabled when you choose this option.</li> <li>• Static – Redistributes static routes to the OSPFv3 routing process.</li> </ul> |
| Metric            | <p>The metric value for the routes being redistributed. Valid values range from 1 to 16777214; the default is 20.</p> <p>When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified.</p>                                                                                                                                                                                                                                                                                     |
| Metric Type       | <p>The metric type is the external link type associated with the default route that is advertised into the OSPFv3 routing domain.</p> <p>Choose None, 1, or 2, where None indicates there is no default route, 1 indicates the metric is a Type 1 external route, and 2 is a Type 2 external route.</p>                                                                                                                                                                                                                                                                                                  |
| Tag (optional)    | <p>The tag is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between other border devices. Valid values range from 0 to 4294967295.</p>                                                                                                                                                                                                                                                                                                                                                                              |
| Route Map         | <p>The name of the route map to apply to the redistribution entry.</p> <p><b>Note</b> This field contains only the Route Map name. The Route Map is created and contained within a FlexConfig; see <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.</p>                                                                                                                                                                                                                                                                                                                           |
| Routing PID       | <p>The ID of the process to which redistribution is directed. (The Process ID is defined on the <a href="#">Process Tab, page 54-24</a>.)</p> <p>This option is enabled only when OSPF is chosen as the Source Protocol.</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Include Connected | <p>Check this box to include connected routes in the redistribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Match**

The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol.

|            |                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------|
| Internal   | The route is internal to a specific autonomous system.                                                   |
| External 1 | Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes. |
| External 2 | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes. |

**Table 54-25 Add/Edit Redistribution Dialog Box (Continued)**

| Element         | Description                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------|
| NSSA External 1 | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes. |
| NSSA External 2 | Routes that are external to the autonomous system, but are imported into OSPF as Type 2 NSSA routes. |

## Add/Edit Summary Prefix Dialog Box (OSPFv3)

Use the Add/Edit Summary Prefix dialog box to add new route-summarization entries to the selected process, or to modify existing entries.

### Navigation Path

You can access the Add/Edit Summary Prefix dialog box from the Summary Prefix panel under the [Process Tab](#), page 54-24.

### Related Topics

- [Configuring OSPFv3](#), page 54-22

### Field Reference

**Table 54-26 Add/Edit Summary Prefix Dialog Box**

| Element            | Description                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID         | This read-only value identifies the process to which this rule applies.                                                                                                                                                                                           |
| IPv6 Prefix/Length | Enter an IPv6 prefix/length for external route summarization.<br><b>Tip</b> You can click <b>Select</b> to select from a list of network objects.                                                                                                                 |
| Advertise          | When selected, summary routes that match the specified prefix and mask pair are advertised. When deselected, routes that match the specified prefix and mask pair are suppressed. By default, this check box is selected.                                         |
| Tag (optional)     | The tag is a 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between border devices. Valid values range from 0 to 4294967295.<br>This field is enabled when you check Advertise. |

## OSPFv3 Interface Tab

Use the Interface panel to configure interface-and neighbor-specific OSPFv3 routing properties. The Interface panel consists of two definition tables, Interface and Neighbor:

- Refer to [Add/Edit Interface Dialog Box \(OSPFv3\)](#), page 54-35 for information about adding and editing Interface table entries.
- Refer to [Add/Edit Neighbor Dialog Box \(OSPFv3\)](#), page 54-38 for information about adding and editing Neighbor table entries.

Refer to [Using Tables, page 1-45](#) for basic information about working with Security Manager tables.

### Navigation Path

Click the Interface tab on the OSPFv3 page to display this panel. For more information about the OSPFv3 page, see [Configuring OSPFv3, page 54-22](#).

### Related Topics

- [About OSPFv3, page 54-22](#)
- [Process Tab, page 54-24](#)

## Add/Edit Interface Dialog Box (OSPFv3)

Use the Add/Edit Interface dialog box to define OSPFv3 routing properties for an individual interface, or to change an existing entry.

### Navigation Path

You can access the Add/Edit Interface dialog box from the Interface panel under the [OSPFv3 Interface Tab, page 54-34](#).

### Related Topics

- [Configuring OSPFv3, page 54-22](#)
- [About OSPFv3, page 54-22](#)

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                                 | The name of the interface to which this routing configuration applies.<br><b>Tip</b> You can click <b>Select</b> to select from a list of interface objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable OSPFv3 on this interface           | Check this box to enable OSPFv3 on the specified interface, and activate the following fields: <ul style="list-style-type: none"> <li>• Process ID – Choose the process to apply to this interface; defined on the OSPFv3 <a href="#">Process Tab, page 54-24</a>.</li> <li>• Area ID – Identify the area to be assigned; areas are also defined on the OSPFv3 <a href="#">Process Tab, page 54-24</a>.</li> <li>• Instance ID – (Optional) Specify an ID for this process instance. Valid values for this setting range from 0 to 255.</li> </ul> This feature lets you have multiple OSPFv3 processes on a single link. Received packets with other instance IDs are then ignored by this process. |
| <b>Properties</b>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Filter outgoing link-state advertisements | Check this box to filter outgoing LSAs. All outgoing LSAs are flooded to the interface by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 54-27 Add/Edit Interface Dialog Box (Continued)**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disable MTU mismatch detection | Check this box to disable the OSPFv3 MTU mismatch detection when database description (DBD) packets are received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flood Reduction                | Check this box to suppress unnecessary flooding of LSAs in stable topologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Point-to-point Network         | Check this box to define this as a link to a point-to-point network; that is, a network between two routing devices. All neighbors on a point-to-point network establish adjacency and there is no designated router.<br><br>This option is unavailable when the Broadcast option is selected.                                                                                                                                                                                                                                                                                                |
| Broadcast                      | Check this box to define this as a link to a network with multiple routing devices. Such networks establish a designated router (DR), as well as a backup designated router (BDR), that controls LSA flooding on the network.<br><br>This option is unavailable when the Point-to-point Network option is selected.                                                                                                                                                                                                                                                                           |
| Cost                           | The cost of sending a packet through the interface. Link cost is an arbitrary number used in shortest path first calculations. If you do not assign a value, the configured reference bandwidth divided by the interface port speed is used. (The default reference bandwidth is 40 Gb/sec.)                                                                                                                                                                                                                                                                                                  |
| Priority                       | Assign an OSPFv3 priority to this interface. Valid values for this setting range from 0 to 255. Entering 0 for this setting makes the device ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, non-broadcast interfaces.<br><br>When two routing devices connect to a network, both attempt to become the designated router. The device with the higher priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router. |
| Dead Interval                  | If no hello packets are received from a neighbor within this interval, that device is designated as inactive. Valid values range from 1 to 65535. The default value for this setting is four times the hello interval.                                                                                                                                                                                                                                                                                                                                                                        |
| Poll Interval                  | If a neighboring device is inactive, it may be necessary to continue sending hello packets to that neighbor. The hello packets are sent at this reduced interval, which should be larger than the hello interval.                                                                                                                                                                                                                                                                                                                                                                             |
| Retransmit Interval            | The time, in seconds, between LSA retransmissions for adjacent neighbors. When a router sends an LSA to a neighbor, it keeps the LSA until it receives an acknowledgment. If an acknowledgment is not received within this interval, it will resend the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links. Valid values range from 1 to 65535 seconds.                                                                                                                                       |

**Table 54-27 Add/Edit Interface Dialog Box (Continued)**

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmit Delay             | The estimated time, in seconds, required to send an LSA packet on the interface. LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links. Valid values range from 1 to 65535 seconds.                                                                                                                                |
| <b>Authentication</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Type                       | The type of authentication enabled on this interface. Choose one of the following: <ul style="list-style-type: none"> <li>Area – OSPFv3 does not provide “built-in” authentication, instead relying on IPv6/IPSec protocols. Choose this option to use those protocols to authenticate OSPFv3 traffic on all interfaces in the area; this means all routing devices in the area must use this option. This is the default.</li> <li>Interface – Choose this option to secure this interface and protect OSPFv3 virtual links. The additional parameters in this section are enabled when you choose this option.</li> <li>None – OSPFv3 authentication is disabled.</li> </ul> |
| Security Parameter Index   | Enter an IPSec identification tag used to distinguish this particular OSPFv3 interface; used in conjunction with the specified authentication and encryption rules. Valid values range from 256 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Authentication Algorithm   | Choose the type of authentication algorithm to use: <ul style="list-style-type: none"> <li>md5 – Message Digest 5; produces a 128-bit hash value.</li> <li>sha1 – Secure Hash Algorithm version 1; produces a 160-bit hash value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Authentication Key         | Enter an authentication key. The length of the key entered depends on the type of authentication chosen as the Authentication Algorithm, and whether the key is to be encrypted (when you check the Encrypt Authentication Key box): <ul style="list-style-type: none"> <li>md5 – 32 characters.</li> <li>md5 (encrypted) – 66 characters.</li> <li>sha1 – 40 characters.</li> <li>sha1 (encrypted) – 82 characters.</li> </ul>                                                                                                                                                                                                                                                |
| Encrypt Authentication Key | Check this box to require encryption of the specified Authentication Key for transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Include Encryption         | Check this box to require encryption of OSPFv3 packets. The following options are enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Add/Edit Neighbor Dialog Box (OSPFv3)

You must define a static neighbor for each point-to-point, non-broadcast interface. This feature lets you broadcast OSPFv3 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel. Note the following restrictions:

- You cannot define the same static neighbor for two different OSPFv3 processes.
- You must define a static route for each static neighbor.

Use the Add/Edit Neighbor dialog box to define a static neighbor for the interface selected in the Interface table, or to change information for an existing static neighbor.

**Navigation Path**

You can access the Add/Edit Neighbor dialog box from the Neighbor panel under the [OSPFv3 Interface Tab](#), page 54-34.

| Interface                | The interface associated with this neighbor definition (read-only).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Link-local Address       | Enter the IPv6 address of the static neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Cost and Database Filter | <p>Check this box to enable filtering of the outgoing LSAs on the interface during synchronization and flooding. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>Cost</b> – Use this field to assign an arbitrary cost to this neighbor. If a value is not assigned, the cost of the interface is used (this value is based on the port speed of the interface, and is calculated as reference bandwidth divided by interface speed). Valid values range from 1 to 65535.</li> <li>• <b>Filter outgoing link-state advertisements</b> – Check this box to disable forwarding of outgoing LSAs to this neighbor.</li> </ul> <p><b>Note</b> The Cost and Database Filter options and the Poll-Interval options are mutually exclusive.</p>                                                                                                                                                                                                                                                                |
| Poll-Interval            | <p>Check this box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Poll Interval</b> – Time interval in seconds between transmission of hello packets to a “dead” neighbor. The default is 120.<br/>If a neighboring device becomes inactive (hello packets have not been received for the dead interval period), it may be necessary to continue sending hello packets to the dead neighbor at a reduced rate. Thus this value should be larger than the interface hello interval.</li> <li>• <b>Priority</b> – The router priority value of this neighbor. The default is 0; valid values range from 1 to 255.<br/>The priority value helps determine the designated router for an OSPFv3 link. A value of zero means the device is ineligible to become the designated router, or backup designated router.</li> </ul> <p><b>Note</b> The Poll-Interval options and the Cost and Database Filter options are mutually exclusive. Also, these values do not apply to point-to-multipoint interfaces.</p> |

# Configuring RIP

Routing Information Protocol (RIP) is a dynamic routing protocol, or more precisely, an interior gateway protocol that is based on distance vectors. RIP uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcast packets with neighboring devices to dynamically learn about and advertise routes. These RIP packets contain information about the destination networks that the gateways can reach, and the number of gateways that a packet must travel through to reach those destinations.

Cisco Security Manager supports both RIP version 1 and RIP version 2. Version 1 does not send the subnet mask with the routing update; RIP version 2 sends the subnet mask with the routing update, and supports variable-length subnet masks. Additionally, RIP version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the security appliance receives reliable routing information from a trusted source.

**Note**

---

You cannot enable RIP if you have OSPF processes running.

---

**Limitations**

RIP has the following limitations:

- Cisco Security Manager cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.

**RIP Version 2 Notes**

The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP version 2 updates to the interface.
- With RIP version 2, the security appliance transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP version 2 configuration is removed from an interface, that multicast address is unregistered.

**Using Security Manager to Configure RIP on Security Appliances**

Use the RIP page to enable the Routing Information Protocol on an interface. The settings and features available when configuring RIP depend on the type of device and OS version that you are configuring:

- To configure RIP on a PIX Firewall or ASA running an OS version earlier than 7.2, or on any FWSM, see [RIP Page for PIX/ASA 6.3–7.1 and FWSM, page 54-41](#).
- To configure RIP on a PIX Firewall or ASA running OS version 7.2 or later, see [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

## RIP Page for PIX/ASA 6.3–7.1 and FWSM

Use this RIP page to enable the Routing Information Protocol (RIP) on an interface in any FWSM, or in a PIX/ASA running a pre-7.2 version operating system.

The RIP table on this page lists all interfaces on which RIP is currently defined. Use the Add RIP Configuration and Edit RIP Configuration dialog boxes to create and maintain these entries. See [RIP Page for PIX/ASA 6.3–7.1 and FWSM, page 54-41](#) for more information.

### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > RIP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

When creating a shared RIP policy, you must choose a Version in the Create a Policy dialog box, as follows:

- **PIX/ASA 6.3-7.1 and FWSM**
- **PIX/ASA 7.2 and Later**

When assigning a shared RIP policy, be sure to assign the appropriate RIP policy for the device. For example, you cannot assign a PIX/ASA 7.2+ RIP policy to an FWSM.

## Add/Edit RIP Configuration (PIX/ASA 6.3–7.1 and FWSM) Dialog Boxes

Use the Add RIP Configuration and Edit RIP Configuration dialog boxes to add a RIP configuration to the security appliance, or to make changes to an existing RIP configuration. By adding a RIP configuration, you enable RIP on the specified interface. Except for their titles, the two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit RIP Configuration dialog boxes from the [RIP Page for PIX/ASA 6.3–7.1 and FWSM, page 54-41](#).

## Field Reference

Table 54-29 Add/Edit RIP Configuration (PIX/ASA 6.3-7.1 and FWSM) Dialog Boxes

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                | Enter or Select the interface for the RIP configuration. You cannot configure two different RIP configurations on the same interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Mode                     | Select the interface behavior regarding RIP updates: <ul style="list-style-type: none"> <li>• <b>Send default routes</b> – The interface will transmit RIP routing updates only.</li> <li>• <b>Receive routes</b> – The interface will listen for RIP routing broadcasts and use that information to populate its routing table, but it will not send RIP routing updates.</li> <li>• <b>Send default routes and receive routes</b> – The interface will send and receive RIP routing updates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Version                  | Select the RIP version to enable on the interface: <ul style="list-style-type: none"> <li>• <b>RIP Version 1</b> – Enables RIP Version 1 on the interface.</li> <li>• <b>RIP Version 2</b> – Enables RIP Version 2 on the interface. Configuring RIP Version 2 registers the multicast address 224.0.0.9 on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Version 2 Authentication | These options let you enable and select the type of authentication used with RIP Version 2. <ul style="list-style-type: none"> <li>• <b>Enable Authentication</b> – This option is available when you select RIP Version 2 above. When this box is checked, RIP neighbor authentication is enabled and the following options become available: <ul style="list-style-type: none"> <li>– <b>Type</b> – Select <b>MD5</b> to use the MD5 hash algorithm for authentication (recommended), or select <b>Clear text</b> to use clear text for authentication.</li> <li>– <b>Key ID</b> – The identification number of the authentication key. This number must be shared with all other devices sending updates to and receiving updates from the security appliance. Valid values range from 1 to 255.</li> <li>– <b>Key</b> – The shared key used for authentication. This key must be shared with all other devices sending updates to and receiving updates from the security appliance. The key can be up to 16 characters.</li> </ul> </li> </ul> |

## RIP Page for PIX/ASA 7.2 and Later

Use this RIP page to enable and configure the Routing Information Protocol (RIP) on PIX and ASA devices running operating system 7.2 or later. The RIP page consists of these tabbed panels:

- [RIP - Setup Tab, page 54-43](#)
- [RIP - Redistribution Tab, page 54-45](#)
- [RIP - Filtering Tab, page 54-46](#)

- [RIP - Interface Tab, page 54-47](#)

#### Navigation Path

- (Device view) Select **Platform > Routing > RIP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > RIP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

When creating a shared RIP policy, you must choose a Version in the Create a Policy dialog box, as follows:

- **PIX/ASA 6.3-7.1 and FWSM**
- **PIX/ASA 7.2 and Later**

When assigning a shared RIP policy, be sure to assign the appropriate RIP policy for the device. For example, you cannot assign a PIX/ASA 7.2+ RIP policy to an FWSM.

## RIP - Setup Tab

Use the Setup panel to define RIP on the security appliance, and to configure global RIP protocol parameters. You can only enable a single RIP process on the security appliance.

#### Navigation Path

You can access the Setup tab from the [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

## Field Reference

Table 54-30 Setup Tab

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks                       | <p>Define one or more networks for RIP routing. Enter IP address(es), or enter or Select the desired Network/Hosts objects (see <a href="#">Understanding Networks/Hosts Objects, page 6-74</a>); IP addresses must not contain any subnet information. There is no limit to the number of networks you can add to the security appliance configuration.</p> <p>The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates.</p>                                                                                                                                                                                                                                       |
| Passive Interface              | <p>Use this option to specify passive interfaces on the security appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates. Choose one of these options:</p> <ol style="list-style-type: none"> <li><b>None</b> – No interfaces are designated as passive.</li> <li><b>All Interfaces</b> – All interfaces on the device are designated as passive, except those entered the Excluded Interfaces field below.</li> <li><b>Specified Interfaces</b> – Only those interfaces explicitly specified in the Interfaces field below are designated as passive.</li> </ol> |
| Interfaces/Excluded Interfaces | <p>Use this field to specify the interfaces excluded from the passive list, or those explicitly designated as passive, depending on your choice from the Passive Interface list above:</p> <ul style="list-style-type: none"> <li>If you chose All Interfaces, this field is labeled <b>Excluded Interfaces</b>: enter or Select only those interfaces to be excluded (that is, those that are to be active not passive).</li> <li>If you chose Specified Interfaces in the Passive Interface list, enter or Select those interfaces that are to be designated as passive.</li> </ul> <p><b>Note</b> You cannot specify two different RIP configurations for the same interface.</p>                                                                                                                                           |
| RIP Version                    | <p>Choose the RIP versions for sending and receiving RIP updates:</p> <ul style="list-style-type: none"> <li>Receive Version 1 and 2, Send Version 1</li> <li>Send and Receive Version 1</li> <li>Send and Receive Version 2</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Generate Default Route         | <p>When selected, a default route is generated for distribution, based on the Route Map you specify.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Route Map                      | <p>Specify the route map to use for generating default routes.</p> <p><b>Note</b> This field contains only the Route Map name. The Route Map is created and contained within a FlexConfig; see <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 54-30 Setup Tab (Continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Auto-Summary | <p>When Send and Receive Version 2 is the chosen RIP Version, this option is available. When checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised.</p> <p><b>Note</b> RIP Version 1 always uses automatic summarization—you cannot disable it.</p> |

## RIP - Redistribution Tab

Use the Redistribution panel to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process. See [Add/Edit Redistribution Dialog Box, page 54-45](#) for more information.

### Navigation Path

You can access the Redistribution tab from the [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

### Related Topics

## Add/Edit Redistribution Dialog Box

Use the Add Redistribution and Edit Redistribution dialog boxes to add and edit redistribution routes on the [RIP - Redistribution Tab, page 54-45](#). These are the routes that are being redistributed from other routing processes into the RIP routing process. Except for their titles, these two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit Redistribution dialog boxes from the Redistribution tab on the [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

### Field Reference

**Table 54-31 Add/Edit Redistribution Dialog Box**

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol to Redistribute | <p>Choose the routing protocol to redistribute into the RIP routing process:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> – Static routes.</li> <li>• <b>Connected</b> – Directly connected networks.</li> <li>• <b>OSPF</b> – Routes discovered by the OSPF routing process.</li> </ul> <p>If you choose OSPF, you must also enter the OSPF Process ID and, optionally, Match criteria.</p> |

**Table 54-31 Add/Edit Redistribution Dialog Box (Continued)**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Process ID   | Enter the process ID when the OSPF protocol is chosen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Match        | <p>If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute. Ctrl-click to select multiple types:</p> <ul style="list-style-type: none"> <li>• Internal – Routes internal to the autonomous system (AS) are redistributed.</li> <li>• External 1 – Type 1 routes external to the AS are redistributed.</li> <li>• External 2 – Type 2 routes external to the AS are redistributed.</li> <li>• NSSA External 1 – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.</li> <li>• NSSA External 2 – Type 2 routes external to an NSSA are redistributed.</li> </ul> <p>Match criteria are optional. The default is match Internal, External 1, and External 2.</p> |
| Metric       | <p>The RIP metric type to apply to the redistributed routes. The two choices are:</p> <ul style="list-style-type: none"> <li>• <b>Transparent</b> – Use the current route metric.</li> <li>• <b>Specified Value</b> – Assign a specific metric value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Metric Value | The metric value to be assigned; enter a value from 0 to 16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Route Map    | <p>The name of a route map that must be satisfied before the route can be redistributed into the RIP routing process.</p> <p><b>Note</b> This field contains only the route Map name. The contents of the route map are created and contained within a FlexConfig. See <a href="#">Chapter 7, “Managing FlexConfigs”</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |

## RIP - Filtering Tab

Use the Filtering panel to manage filters for the RIP policy. Filters are used to limit network information in incoming and outgoing RIP advertisements. See [Add/Edit Filter Dialog Box, page 54-47](#) for more information.

### Navigation Path

You can access the Filtering tab from the [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

### Related Topics

- [RIP - Setup Tab, page 54-43](#)
- [RIP - Redistribution Tab, page 54-45](#)
- [RIP - Interface Tab, page 54-47](#)
- [Chapter 54, “Configuring Routing Policies on Firewall Devices”](#)

## Add/Edit Filter Dialog Box

Use the Add Filter and Edit Filter dialog boxes to add and edit RIP filters on the [RIP - Filtering Tab, page 54-46](#). Filters are used to limit network information in incoming and outgoing RIP advertisements. Except for their titles, these two dialog boxes are identical.

### Navigation Path

You can access the Add and Edit Filter dialog boxes from the Filtering tab on the [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

### Field Reference

**Table 54-32 Add/Edit Filter Dialog Box**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Direction | Choose the type of traffic to be filtered: <b>Inbound</b> or <b>Outbound</b> .<br><b>Note</b> If Traffic Direction is Inbound, you can define an Interface filter only.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Filter On         | Specify whether the filter is based on an <b>Interface</b> or a <b>Route</b> .<br>If you select Interface, enter or Select the name of the interface on which routing updates are to be filtered.<br>If you select Route, choose the route type: <ul style="list-style-type: none"> <li>• <b>Static</b> – Only static routes are filtered.</li> <li>• <b>Connected</b> – Only connected routes are filtered.</li> <li>• <b>OSPF</b> – Only OSPF routes discovered by the specified OSPF process are filtered. Enter the Process ID of the OSPF process to be filtered.</li> </ul> |
| Filter ACLs       | Enter or Select the name of one or more access control lists (ACLs) that define the networks to be allowed or removed from RIP route advertisements.                                                                                                                                                                                                                                                                                                                                                                                                                              |

## RIP - Interface Tab

Use the Interface panel to manage the interfaces configured to send and receive RIP broadcasts. See [Add/Edit Interface Dialog Box, page 54-48](#) for more information.

### Navigation Path

You can access the Interface tab from the [RIP Page for PIX/ASA 7.2 and Later, page 54-42](#).

|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface           | Enter or Select an interface defined on this appliance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Send (Version)      | These options let you override, for this interface, the global Send versions specified on the <a href="#">RIP - Setup Tab, page 54-43</a> . Select the appropriate boxes to specify sending updates using RIP Version 1, Version 2, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Receive (Version)   | These options let you override the global Receive versions. Select the appropriate boxes to specify accepting updates using RIP Version 1 only, Version 2 only, or both.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Authentication type | <p>Choose the authentication used on this interface for RIP broadcasts:</p> <ul style="list-style-type: none"> <li>• <b>None</b> – No authentication.</li> <li>• <b>MD5</b> – Employ MD5.</li> <li>• <b>Clear Text</b> – Employ clear-text authentication.</li> </ul> <p>If you choose MD5 or Clear Text, you must also provide the following authentication parameters:</p> <ul style="list-style-type: none"> <li>• <b>Key ID</b> – The ID of the authentication key. Valid values are from 0 to 255.</li> <li>• <b>Key</b> – The key used by the chosen authentication method. Can contain up to 16 characters.</li> <li>• <b>Confirm</b> – Enter the authentication key again, to confirm.</li> </ul> |

## Configuring Static Routes

A static route is a specific path to a particular destination network that is manually defined on the current device. Static routes are used in a variety of situations, and can be a quick and effective way to route data from one network to another when there is no dynamic route to the destination, or when use of a dynamic routing protocol is not feasible.

All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.

For static routes, the default metric value is one, which gives them precedence over routes from dynamic routing protocols. If you increase the metric to a value greater than that of a dynamic route, the static route operates as a back-up in the event that dynamic routing fails. For example, Open Shortest Path First

(OSPF)-derived routes have a default administrative distance of 100. To configure a back-up static route that is overridden by an OSPF route, specify a metric value for the static route that is greater than 100. This is referred to as a “floating” static route.

There is a special kind of static route known as a default route, or a “zero-zero” route because all zeroes are used for both the destination address and subnet mask. The default static route serves as a catch-all gateway: if there are no matches for a particular destination in the device’s routing table, the default route is used. The default route generally includes a next-hop IP address or local exit interface.

Use the Static Route page to maintain manually defined static routes. The Static Route table on this page lists all currently defined static routes, showing for each, the name of the interface or interface role for which the route is defined, the destination network(s), the next hop gateway, the route metric, whether the route is tunneled, and whether there is service-level agreement tracking for the route. For a detailed explanation of these fields, see [Add/Edit Static Route Dialog Box, page 54-49](#) or [Add/Edit IPv6 Static Route Dialog Box, page 54-50](#).

#### Navigation Path

- (Device view) Select **Platform > Routing > Static Route** or **Platform > Routing > IPv6 Static Route** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Routing > Static Route** or **PIX/ASA/FWSM Platform > Routing > IPv6 Static Route** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | Enter or Select the interface to which this static route applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Network        | Enter or Select the destination network(s). You can provide one or more IP address/netmask entries, one or more Networks/Hosts objects, or a combination of both; separate the entries with commas.<br><br>Enter “0.0.0.0/0” or “any” to specify a default route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Gateway        | Enter or Select the gateway router which is the next hop for this route. You can provide an IP address, or a Networks/Hosts object.<br><br><b>Note</b> If an IP address from one of the security appliance’s interfaces is used as the Gateway IP address, the security appliance will resolve the designated IP address in the packet instead of resolving the Gateway IP address.                                                                                                                                                                                                                                                                                                                                                                  |
| Metric         | The Metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. Because the hop count includes the destination network, all directly connected networks have a metric of 1.<br><br>Enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1.<br><br>The maximum number of equal-cost (equal-metric) routes that can be defined per interface is three. You cannot add a route with the same metric on different interfaces that are on the same network. |
| Tunneled       | Select this option to make this a tunnel route; can be used only for a default route. You can configure only one default tunneled gateway per device. The Tunneled option is not supported in transparent mode. Available only on PIX/ASA 7.0+ devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Route Tracking | To monitor route availability, enter or Select name of an SLA (service level agreement) object that defines the monitoring policy. Available only on PIX/ASA 7.2+ devices.<br><br>For more information on route tracking, see <a href="#">Monitoring Service Level Agreements (SLAs) To Maintain Connectivity, page 50-7</a> .                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Add/Edit IPv6 Static Route Dialog Box

The Add/Edit IPv6 Static Route dialog box lets you add or edit an IPv6 static route. IPv6 static routes are only supported on the following devices:

- ASA 7.0 and later (Routed mode)
- ASA 8.2 and later (Transparent mode)
- FWSM 3.1 and later (Routed mode)

**Navigation Path**

You can access the Add/Edit IPv6 Static Route dialog box from the IPv6 Static Route page. Click the **Add Row** button to add a new static route; select an existing static route and click the **Edit Row** button to edit that route.

| Interface    | Enter or Select the interface to which this static route applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IPv6 Network | Enter or Select the destination network(s). You can provide one or more IP address entries, one or more Networks/Hosts objects, or a combination of both; separate the entries with commas.<br><br>Enter two colons (::) to specify a default route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IPv6 Gateway | Enter or Select the gateway router which is the next hop for this route. You can provide an IP address, or a Networks/Hosts object.<br><br><b>Note</b> If an IP address from one of the security appliance’s interfaces is used as the Gateway IP address, the security appliance will resolve the designated IP address in the packet instead of resolving the Gateway IP address.                                                                                                                                                                                                                                                                                                                                                                  |
| Metric       | The Metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. Because the hop count includes the destination network, all directly connected networks have a metric of 1.<br><br>Enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1.<br><br>The maximum number of equal-cost (equal-metric) routes that can be defined per interface is three. You cannot add a route with the same metric on different interfaces that are on the same network. |
| Tunneled     | Select this option to specify the route as the default tunnel gateway for VPN traffic. You can configure only one default tunneled gateway per device. Available only on ASA 7.0+ devices in routed mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# CHAPTER 55

## Configuring Security Policies on Firewall Devices

You can configure general security settings for the device using the General page and the Timeouts page under Platform > Security. You can enable anti-spoofing on interfaces, configure IP fragment settings, and configure a variety of timeout values for the device.

This chapter contains the following topics:

- [General Page, page 55-1](#)
- [Configuring Timeouts, page 55-4](#)

### General Page

Use the General page to configure security settings that help protect against malformed packets, spoofed packets, fragmented packets, and denial of service attacks. See [Configuring Floodguard, Anti-Spoofing and Fragment Settings, page 55-2](#) for more information about the settings on this page.

#### Navigation Path

- (Device view) Select **Platform > Security > General** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Security > General** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

#### Related Topics

| Use these options to configure global fragment settings for the device. You can override these settings for individual interfaces; see <a href="#">Add/Edit General Security Configuration Dialog Box, page 55-3</a> for more information. |                                                                                                                                                                                                                                                                                                                                              |
| Enable Default Settings                                                                                                                                                                                                                    | Check this box to enable the default fragment settings fields.                                                                                                                                                                                                                                                                               |
| Size                                                                                                                                                                                                                                       | Specify the maximum number of fragments that can be in the IP re-assembly database waiting for re-assembly. The default is 200.                                                                                                                                                                                                              |
| Chain                                                                                                                                                                                                                                      | Specify the maximum number of fragments into which a full IP packet can be fragmented. The default is 24 packets.                                                                                                                                                                                                                            |
| Timeout                                                                                                                                                                                                                                    | Specify the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds. |

**Interface Configuration Table**

This table lists all interfaces on which individual anti-spoofing and fragment settings have been defined. Refer to [Configuring Floodguard, Anti-Spoofing and Fragment Settings, page 55-2](#) for more information about these settings. Refer to [Add/Edit General Security Configuration Dialog Box, page 55-3](#) for more information about configuring these settings on individual interfaces.

## Configuring Floodguard, Anti-Spoofing and Fragment Settings

Use the General page under Platform > Security to enable or disable Floodguard (on a PIX 6.3 or FWSM 2.x device), to enable Unicast Reverse Path Forwarding (anti-spoofing) on individual interfaces, and to configure IP fragment settings for the device, and for each interface of the device.

**Floodguard**

Floodguard lets you reclaim firewall resources if the user authentication subsystem runs out of resources. If an inbound or outbound `uauth` connection is being attacked or overused, the firewall will actively reclaim TCP user resources.

If the user authentication subsystem is depleted, TCP user resources in different states are reclaimed in the following order, depending on urgency:

1. Timewait
2. LastAck
3. FinWait
4. Embryonic
5. Idle

Floodguard is enabled by default. This option applies only to PIX 6.3 or FWSM 2.x devices.

### Anti-spoofing

Unicast Reverse Path Forwarding (RPF) guards against IP spoofing—a packet using an incorrect source IP address to obscure its true source—by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the security appliance looks only at the destination address when determining where to forward the packet. Unicast RPF instructs the security appliance to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the security appliance, the security appliance routing table must include a route back to the source address. See RFC 2267 for more information.

With outside traffic, for example, the security appliance can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the security appliance uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, the security appliance drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the security appliance drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:

- ICMP packets have no session, so each packet is checked.
- UDP and TCP have sessions, so the initial packet requires a reverse route look-up. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

### Fragment Settings

Fragment settings provide management of packet fragmentation and improve compatibility with the Network File System (NFS). By default, the security appliance allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to allow fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the security appliance, as fragmented packets are often used as DoS attacks.

|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                          | Enter or Select the name of the interface for which you want to configure anti-spoofing or fragment settings.                                                                                                                                                                                                                                                           |
| Enable Anti-Spoofing               | Check this box to enable Unicast RPF (anti-spoofing) on the specified interface.                                                                                                                                                                                                                                                                                        |
| Override Default Fragment Settings | To override the default fragment settings on the specified interface, check this box to enable the following fields, and then enter the new values. See the <a href="#">General Page, page 55-1</a> for the default global fragment settings on the device.                                                                                                             |
| Size                               | Specify the maximum number of fragments that can be in the IP re-assembly database waiting for re-assembly for the specified interface. The default is 200.                                                                                                                                                                                                             |
| Chain                              | Specify the maximum number of fragments into which a full IP packet can be fragmented for the specified interface. The default is 24 packets.                                                                                                                                                                                                                           |
| Timeout                            | Specify the maximum number of seconds to wait for an entire fragmented packet to arrive on the specified interface. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds. |

## Configuring Timeouts

The Timeouts page lets you set a variety of timeout values on the security appliance. All times are in the format **hh:mm:ss**.

These values represent idle timeouts for the connection and translation slots for various protocols. If a slot has not been used for the idle time specified, the resource is returned to the free pool. TCP connection slots are freed approximately 60 seconds after a normal connection close sequence.

### Warning

**We recommend that you do not change these values unless advised to do so by Customer Support.**

### Navigation Path

- (Device view) Select **Platform > Security > Timeouts** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Security > Timeouts** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | To change the timeout value for a parameter, click the radio button to the left of the parameter entry to activate it, and then enter the new value in the parameter field. To reset any value to its default, click the related Default button.<br><br>Clicking the Disable button, where provided, disables the timeout by setting its value to 0:00:00. Follow either of the procedures in the previous paragraph to re-enable a disabled value. |
| Translation Slot (xlate)            | Length of time idle until a translation slot is freed. This value must be at least 1 minute; the default is 3 hours. Enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                                           |
| Connection (conn)                   | Length of time idle until a connection slot is freed. This value must be at least 5 minutes; the default is 1 hour. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                           |
| Half-Closed                         | Length of time idle until a half-closed TCP connection is closed. The minimum is 5 minutes; the default is 10 minutes. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                        |
| UDP                                 | Length of time idle until a UDP protocol connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                |
| ICMP (PIX 7.x+, ASA, FWSM 3.x+)     | Length of time idle after which general ICMP states are closed.                                                                                                                                                                                                                                                                                                                                                                                     |
| RPC/Sun RPC                         | Length of time idle until a SunRPC slot is freed. This value must be at least 1 minute; the default is 10 minutes. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                            |
| H.225                               | Length of time idle until an H.225 signaling connection is closed. The H.225 default timeout is 1 hour (01:00:00). Setting the value to 00:00:00 means never close the connection. To close a connection immediately after all calls are cleared, enter 1 second (00:00:01).                                                                                                                                                                        |
| H.323                               | Length of time idle until an H.323 media connection is closed. The default is 5 minutes. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                                                      |
| MGCP                                | Length of time idle after which MGCP media ports are closed. The default is 5 minutes (00:05:00). Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                                                             |
| MGCP PAT (PIX 7.x+, ASA, FWSM 3.x+) | Length of time idle after which an MGCP PAT translation is removed. The minimum time is 30 seconds; the default is 5 minutes (00:05:00). Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                      |
| SIP                                 | Length of time idle until an SIP signaling port connection is closed. This value must be at least 5 minutes; the default is 30 minutes. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                       |
| SIP Media                           | Length of time idle until an SIP media port connection is closed. This value must be at least 1 minute; the default is 2 minutes. Click Disable or enter 0:0:0 to disable this timeout.                                                                                                                                                                                                                                                             |

Table 55-3 Timeouts Page (Continued)

| Element                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP Disconnect (PIX 6.3(5), PIX/ASA 7.2+, FWSM 3.2+) | Length of time idle after which a SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message. The minimum value is 0:0:1; the maximum value is 0:10:0. The default value is 0:02:00.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SIP Invite (PIX 6.3(5), PIX/ASA 7.2+, FWSM 3.2+)     | Length of time idle after which pinholes for PROVISIONAL responses and media xlates will be closed. The minimum value is 0:1:0; the maximum value is 0:30:0. The default value is 0:03:00.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SIP Provisional Media (PIX/ASA 7.2(3)+)              | The timeout value for SIP provisional media connections; must be a value between 0:1:0 and 1193:0:0. The default is 2 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Auth. (uath) Absolute                                | <p>Length of time until the authentication cache times out and new connections must be re-authenticated. The system waits until a user starts a new connection to prompt for re-authentication. This time must be shorter than the Translation Slot value. Click Disable or enter 0:0:0 to disable caching and require re-re-authentication on every new connection.</p> <p><b>Note</b> Do not set this value to 0:0:0 if passive FTP is used on the connections.</p> <p><b>Note</b> If you set this value to 0:0:0; HTTPS authentication may not work. If a browser initiates multiple TCP connections to load a Web page after HTTPS authentication, the first connection is permitted through, but subsequent connections trigger authentication. As a result, users are continuously presented with an authentication page, even after successful authentication. To work around this, set the authentication absolute timeout to 1 second. However, this workaround opens a one-second window of opportunity that might allow non-authenticated users through the firewall if they are coming from the same source IP address.</p> |
| Auth. (uath) Inactivity                              | Length of time idle until the authentication cache times out and users have to re-authenticate new connections. This duration must be shorter than the Translation Slot value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## CHAPTER 56

# Configuring Service Policy Rules on Firewall Devices

---

This section describes configuring service policy rules. Service policies provide a consistent and flexible way to configure certain security appliance features, including priority queuing, application inspection, and QoS (quality of service). For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications.

### Note

Detailed information regarding the range and implementation of particular service policies can be found on [cisco.com](http://cisco.com). For example, the following references may be helpful:

[Using Modular Policy Framework](#)

[QoS Configuration and Monitoring](#)

---

This chapter contains the following topics:

- [About Service Policy Rules, page 56-1](#)
- [About TCP State Bypass, page 56-3](#)
- [Priority Queues Page, page 56-4](#)
- [IPS, QoS, and Connection Rules Page, page 56-5](#)
- [Configuring Traffic Flow Objects, page 56-16](#)
- [Configuring TCP Maps, page 56-20](#)

## About Service Policy Rules

Service policy rules encompass these features:

- TCP and general connection settings (including TCP State Bypass; see [About TCP State Bypass, page 56-3](#))
- Content security control (CSC)
- Application inspection
- Intrusion Prevention Services
- QoS queuing and policing

- ASA CX redirection (see [About the ASA CX, page 56-15](#))
- User statistics for identity-based firewall policies

The configuration options for these features are presented on two pages in Security Manager—**Priority Queues** and **IPS, QoS and Connection Rules**—accessed by navigating to Platform > Service Policy Rules.

### Priority Queuing

Priority queuing establishes two queues on an interface, a Low Latency Queuing (LLQ) priority queue and a “best effort” queue. This lets you prioritize latency-sensitive traffic like voice and video, so it is transmitted ahead of other traffic. Packets in the priority queue are always transmitted before packets in the best effort queue.

Because queues are not of infinite size, they can fill and overflow. When a queue is full, additional packets cannot get into the queue and are dropped. This is called “tail drop.” To minimize tail drop, you can increase the queue buffer size. You can also fine-tune the maximum number of packets allowed into the transmit queue. These options let you control the latency and robustness of priority queuing.

Priority queuing is a Quality of Service (QoS) feature. In Security Manager, priority queue size and transmit queue size are managed on the [Priority Queues Page, page 56-4](#), while establishment of priority queuing for a traffic class is an option on the QoS tab of the Service Policy (MPC) Rule Wizard, which is accessed from the [IPS, QoS, and Connection Rules Page, page 56-5](#).

### Application Inspection and QoS

Some applications require special handling by the security appliance, and specific application inspection engines are provided for this purpose. Specifically, applications that embed IP addressing information in the user data packet, or open secondary channels on dynamically assigned ports require special inspection.

Application inspection is enabled by default for many protocols, while it is disabled for others. In many cases, you can change the port which the application inspection engine monitors for traffic.

Application inspection engines work with network address translation (NAT) to help identify the location of embedded addressing information. This allows NAT to translate these embedded addresses, and to update any checksum or other fields that are affected by the translation.

Service policy rules define how specific types of application inspection are applied to different types of traffic processed by the security appliance. You can apply rules to specific interfaces, or globally to every interface.

These rules provide a means to configure security appliance features in a manner similar to the Cisco IOS software quality-of-service (QoS) CLI. For example, with service policy rules you can include IP Precedence as one of the criteria to identify traffic for rate-limiting. You can also create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications.

Traffic match criteria are used to define the types of traffic to which you want to apply application inspection. For example, TCP traffic on port 23 might be classified as the Telnet traffic class. You then might use the traffic class to apply connection limits.

Multiple traffic match criteria can be assigned to a single interface, but a packet will only match the first criteria within a specific service policy rule.

# About TCP State Bypass

By default, all traffic that enters an ASA or FWSM is inspected using the Adaptive Security Algorithm, and is either allowed through or dropped based on the security policy. The device maximizes its firewall performance by checking the state of each packet—to determine whether this a new connection, or an established connection—and assigning it to the session management path (if it is a new connection SYN packet), the fast path (if it is an established connection), or the control-plane path (for advanced inspection).

**Note**

---

TCP State Bypass is available on FWSM 3.2+ and ASA 8.2+ devices only.

---

TCP packets that match existing connections in the fast path can pass through the appliance without every aspect of the security policy being rechecked. This feature maximizes performance. However, the method of establishing the session in the fast path using the SYN packet, and the checks that occur in the fast path (such as TCP sequence number), require that both outbound and inbound flows for a connection pass through the same device, which is not the case in asymmetric routing environments.

For example, assume a new connection is assigned to security device 1. The SYN packet goes through the session management path, and an entry for the connection is added to the fast path table. If subsequent packets of this connection go through device 1, then the packets match the entry in the fast path, and are passed through. But if subsequent packets go to device 2, where a SYN packet did not go through the session management path, there is no entry in the fast path for the connection, and the packets are dropped.

Thus, if you have asymmetric routing configured on upstream routers, and traffic alternates between two security devices, enable TCP state bypass for those specific traffic flows. TCP state bypass alters the way sessions are established in the fast path and disables the fast path checks. TCP traffic is then treated much as a UDP connection is treated: when a non-SYN packet matching the specified networks enters the security device, and there is not a fast path entry, then the packet goes through the session management path to establish a connection in the fast path. Once in the fast path, the traffic bypasses the fast path checks.

### Unsupported Features

The following features are not supported when you enable TCP state bypass:

- Application inspection – Application inspection requires both inbound and outbound traffic to go through the same security device, so application inspection is not supported with TCP state bypass.
- AAA authenticated sessions – When a user authenticates with one security device, traffic returning via the other security device will be denied because the user did not authenticate with that device.
- TCP Intercept, Maximum Embryonic Connections limit, TCP sequence number randomization – If TCP state bypass is enabled, the device does not keep track of the state of the connection, so these features are not applicable.
- Cisco CSC SSM (Content Security and Control Security Services Module) – SSM and SSC functionality cannot be used with TCP state bypass.

### Compatibility with NAT

Because the translation session is established separately for each security device, be sure to configure static NAT on both devices for TCP state bypass traffic; if you use dynamic NAT, the address chosen for the session on device 1 will differ from the address chosen for the session on device 2.

## Priority Queues Page

Priority queues let you define how traffic is prioritized in the network. You can define a series of filters based on packet characteristics to cause traffic to be placed in a higher or lower priority queue. The queue with the highest priority is serviced first until it is empty, then the lower queues are serviced in sequence.

In Security Manager, priority queue size and transmit queue size are managed on this page, while establishment of priority queuing for a traffic class is an option on the QoS tab of the Service Policy (MPC) Rule Wizard, which is accessed from the [IPS, QoS, and Connection Rules Page, page 56-5](#).

The Priority Queue Configuration dialog box is used to add and edit these queues. Refer to [Priority Queue Configuration Dialog Box, page 56-4](#) for descriptions of the fields displayed in the Priority Queues table on this page.

**Note**

---

Priority queuing is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

**Navigation Path**

- (Device view) Select **Platform > Service Policy Rules > Priority Queues** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy Rules > Priority Queues** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Priority Queue Configuration Dialog Box

Use the Priority Queue Configuration dialog box to define and edit the priority queues on the Priority Queues page.

**Note**

---

Priority queuing is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

**Navigation Path**

You open the Priority Queue Configuration dialog box by clicking the Add Row or Edit Row buttons on the [Priority Queues Page, page 56-4](#).

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name          | Specify the interface to which this rule applies; you can enter the interface name, or click Select to choose an available interface.                                                                                                                                                                                                                                                                                                                   |
| Queue Limit             | Enter the maximum number of packets that can be queued in a priority queue before it drops data. This limit must be in the range of 0 through 2048 packets.                                                                                                                                                                                                                                                                                             |
| Transmission Ring Limit | Enter the maximum number of packets allowed into the transmit queue. This fine-tuning of the transmit queue can reduce latency and offer better performance through the transmit driver.<br><br>On PIX devices, this value can range from 3 through 128 packets. On ASAs prior to version 7.2, this limit can be in the range 3 through 256 packets, while on ASAs running version 7.2 and higher, the value can be in the range 3 through 512 packets. |

## IPS, QoS, and Connection Rules Page

Use the IPS, QoS, and Connection Rules page to define new service policy rules, and to edit or delete existing service policy rules.

Configuring IPS, QoS and Connection Rules consists of three tasks:

1. **Configure a service policy.** Create a service policy and determine the interfaces to which the service policy applies. For more information, see [Step 1. Configure a Service Policy, page 56-6](#).
2. **Configure the traffic class.** Specify the criteria you want to use to identify the traffic to which the service policy applies. For more information, see [Step 2. Configure the traffic class, page 56-7](#).
3. **Configure the actions.** Specify the actions that should be taken to protect information or resources, or to perform QoS functions for the traffic specified in this service policy. For more information, see [Step 3. Configure the MPC actions, page 56-8](#).

The three tasks are performed using the [Insert/Edit Service Policy \(MPC\) Rule Wizard, page 56-6](#). Refer to the individual task topics for descriptions of the fields displayed in the IPS, QoS and Connection Rules table on this page.

**Navigation Path**

- (Device view) Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**ASA CX Auth Proxy Configuration**

The CXSC Auth Proxy button below the IPS, QoS, and Connection Rules table opens the Add/Edit CXSC Auth Proxy Configuration dialog box, which is described in [ASA CX Auth Proxy Configuration, page 56-16](#).

The CXSC Auth Proxy button is available below the IPS, QoS, and Connection Rules table only in Device view; it is not visible in Policy view.

**Note**

Security Manager uses “CXSC” in some places to refer to an ASA CX Security Services Processor (SSP).

  - [Table Columns and Column Heading Features, page 1-46](#)

## Insert/Edit Service Policy (MPC) Rule Wizard

Use the Insert/Edit Service Policy (MPC) Rule wizard to add and edit service policy rules on the IPS, QoS, and Connection Rules page. The Insert/Edit Service Policy (MPC) Rule wizard presents the following steps:

- [Step 1. Configure a Service Policy, page 56-6](#)
- [Step 2. Configure the traffic class, page 56-7](#)
- [Step 3. Configure the MPC actions, page 56-8](#)

**Note**

“MPC” refers to what is now called the Modular Policy Framework. Refer to [Using Modular Policy Framework](#) for additional information.

**Navigation Path**

Open the Insert/Edit Service Policy (MPC) Rule wizard by clicking the Add Row or Edit Row button on the [IPS, QoS, and Connection Rules Page, page 56-5](#).

### Step 1. Configure a Service Policy

The first step in using the Insert/Edit Service Policy (MPC) Rule Wizard to configure an IPS, QoS and Connection Rule involves enabling the rule and specifying the interface(s) to which it is applied.

**Navigation Path**

Open the Insert/Edit Service Policy (MPC) Rule wizard by clicking the Add Row or Edit Row button on the [IPS, QoS, and Connection Rules Page, page 56-5](#).

**Related Topics**

- [Step 2. Configure the traffic class, page 56-7](#)
- [Step 3. Configure the MPC actions, page 56-8](#)

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable The Current MPC Rule        | Check this box to enable this service policy rule. You can deselect this option if you want to define the rule now, but not deploy it to the device until later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category                           | To assign the rule to a category, choose the category from the list. Categories can help you organize and identify rules and objects. For more information, see <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description                        | Optionally, enter a description for the service policy rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Global - Applies to All Interfaces | Select this option to apply the rule globally to all interfaces. This option is not compatible with matching traffic based on the source or destination IP address using an access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interfaces                         | Select this option to apply the rule to a specific interface or group of interfaces (or interface roles), and then enter or Select the name of an interface or interface object.<br><br>This selection is required if you want to match traffic based on the source or destination IP address using an access list.<br><br><b>Note</b> Interface-specific rules take precedence over the global service policy for a given feature. For example, if you have a global policy with FTP inspection, and an interface policy with TCP connection limits, then both FTP inspection and TCP connection limits are applied to the interface. However, if you have a global policy with FTP inspection, and an interface policy with FTP inspection, then only the interface policy FTP inspection is applied to that interface. |

**Step 2. Configure the traffic class**

The second step in using the Insert/Edit Service Policy (MPC) Rule Wizard to configure an IPS, QoS and Connection Rule involves specifying the traffic class to which the rule is applied.

Specify the class to use to match traffic for this rule:

- **Use class-default As The Traffic Class**—Select this option to use the traffic class `class-default` for this service policy. The class-default traffic class matches all traffic.
- **Traffic Class**—Select this option to apply this rule to a specific traffic class. Enter the name of the previously defined traffic class, or click **Select** to select it from the Traffic Flows Selector.

You also can define or edit a traffic flow “on the fly” by clicking the either Create or Edit buttons in the Traffic Flows Selector. (Traffic flows are also created and edited on the Traffic Flows page of the Policy Object Manager.) See [Configuring Traffic Flow Objects, page 56-16](#) for more information.

### Step 3. Configure the MPC actions

The third step in the Insert/Edit Service Policy (MPC) Rule Wizard involves specifying IPS, CXSC, Connection Setting, QoS, CSC, User Statistics, and ScanSafe Web Security parameters for the rule; each set of parameters is presented on a separate tabbed panel.

| <b>Intrusion Prevention tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable IPS for this Traffic     | <p>Enables or disables intrusion prevention for this traffic flow. When this box is checked, the other parameters on this panel are available.</p> <p><b>Note</b> These parameters are applicable only on ASA 7.0+ devices that have an IPS module installed. See <a href="#">About IPS Modules on ASA Devices, page 56-14</a> for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IPS Mode                        | <p>Select the operating mode for intrusion prevention:</p> <ul style="list-style-type: none"> <li>• <b>Inline</b>—This mode places the IPS module directly in the traffic flow. No traffic that you identified for IPS inspection can continue through the ASA without first passing through, and being inspected by, the IPS module. This mode is the most secure because every packet identified for inspection is analyzed before being allowed through. Also, the IPS module can implement a blocking policy on a packet-by-packet basis. However, this mode can affect throughput.</li> <li>• <b>Promiscuous</b>—This mode sends a duplicate stream of traffic to the IPS module. This is less secure than Inline mode, but has little impact on traffic throughput. Unlike Inline mode, in Promiscuous mode the IPS module cannot drop the original packets, it can only block traffic by instructing the ASA to shun the traffic, or by resetting the connection on the appliance.</li> </ul> <p>Also, while the IPS module is analyzing the traffic, a small amount of traffic may pass through the ASA before the IPS module can shun it.</p> |
| On IPS Card Failure             | <p>Specify the action to be taken if the IPS module becomes inoperable. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Open</b>—Permits traffic if the module or card fails.</li> <li>• <b>Close</b>—Blocks traffic if the module or card fails.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Virtual Sensor                  | Text box in which you can view, edit, or remove the virtual sensor in the service policy that you are adding or editing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Connections | <p>You can specify the maximum number of TCP and UDP connections, and the maximum number of embryonic connections for this traffic flow:</p> <ul style="list-style-type: none"> <li>• <b>Maximum TCP &amp; UDP Connections</b> – Specify the maximum number of simultaneous TCP and UDP connections for the entire subnet, up to 65,535, for ASA versions earlier than 8.4(5); for ASA 8.4(5) and later, the maximum number is 2,000,000. The default is zero for both protocols, which means the maximum possible connections are allowed.</li> <li>• <b>Maximum TCP &amp; UDP Connections Per Client</b> – For ASA/PIX 7.1+ only; specify the maximum number of simultaneous TCP and UDP connections on a per client basis. For ASA 8.4(5) and later, the maximum number is 2,000,000.</li> <li>• <b>Maximum Embryonic Connections</b> – For ASA/PIX 7.0+ only; specify the maximum number of embryonic connections per host, up to 65,535, for ASA versions earlier than 8.4(5); for ASA 8.4(5) and later, the maximum number is 2,000,000. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. This limit enables the TCP Intercept feature. The default is zero, which means the maximum embryonic connections. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server. This feature is not applicable if TCP State Bypass is enabled.</li> <li>• <b>Maximum Embryonic Connections Per Client</b> – For ASA/PIX 7.1+ only; specify the maximum number of embryonic connections on a per client basis. For ASA 8.4(5) and later, the maximum number is 2,000,000. This feature is not applicable if TCP State Bypass is enabled.</li> </ul> |

**Table 56-3** Insert/Edit Service Policy (MPC) Rule Wizard—Step 3. Configure the actions.

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Timeouts           | <p>You can specify the following connection timeout settings for this traffic flow:</p> <ul style="list-style-type: none"> <li>• <b>Embryonic Connection Timeout</b> – Specify the idle time until an embryonic connection slot is freed. Enter 0:0:0 to disable timeout for the connection. The default is 20 seconds for FWSMs, and 30 seconds for ASA/PIX devices.</li> <li>• <b>Half Closed Connection Timeout</b> – Specify the idle time until a half-closed connection slot is freed. Enter 0:0:0 to disable timeout for the connection.<br/><br/>For FWSMs, the default value is 20 seconds; the maximum value is 255 seconds (four minutes, 15 seconds).<br/><br/>For ASA/PIX devices, this duration must be at least 5 minutes; the default is 10 minutes.</li> <li>• <b>TCP Connection Timeout</b> – Specify the idle time until a connection slot is freed. Enter 0:0:0 to disable timeout for the connection. This duration must be at least 5 minutes. The default is 1 hour.</li> </ul> |
| Reset Connection Upon Timeout | If selected, connections are reset after a timeout occurs. Available for ASA/PIX 7.0(4)+ only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Detect Dead Connections       | <p>Enables the Dead Connection Detection feature; available for ASA/PIX 7.2+ devices. Selecting this option enables these two fields:</p> <ul style="list-style-type: none"> <li>• <b>Dead Connection Detection Timeout</b> – Specify the period of time between retries when a dead connection is detected. The default is 15 seconds.</li> <li>• <b>Dead Connection Detection Retries</b> – Specify the number of retries to be performed after a dead connection is detected. The default is five.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Traffic Flow Idle Timeout     | Specify the period of time between a traffic flow becoming idle and the flow's disconnection. Applicable to FWSM 3.2+ only. The default is 1 hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable TCP Normalization      | Enables TCP normalization, and activates the TCP Map selection option. Applies to ASA/PIX 7.0+ only; not applicable if TCP State Bypass is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TCP map                       | Specify the TCP map to use for TCP normalization: enter or Select the name of a TCP map. For more information, see <a href="#">Configuring TCP Maps, page 56-20</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 56-3** *Insert/Edit Service Policy (MPC) Rule Wizard—Step 3. Configure the actions.*

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Randomize TCP Sequence Number | Enables the Randomize Sequence Number feature. Disable this feature only if another inline security appliance is also randomizing sequence numbers and the result is scrambling the data. Each TCP connection has two Initial Sequence Numbers: one generated by the client and one generated by the server. The security appliance randomizes the ISN that is generated by the host/server on the higher security interface. At least one ISN must be randomly generated so that attackers cannot predict the next ISN and potentially hijack the session. Not applicable if TCP State Bypass is enabled.                                                                                                                                                                                                                                                               |
| Enable TCP State Bypass       | Enables TCP state bypass for this traffic flow. This allows specific traffic flows in asymmetric routing environments when both the outbound and inbound flow for a connection do not pass through the same device. Applicable to FWSM 3.2+ and ASA 8.2+ only. See <a href="#">About TCP State Bypass, page 56-3</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Decrement TTL          | Select this option to turn on decrementing of the time-to-live (TTL) value in packets passed by the security appliance. Applicable to PIX/ASA 7.2.2+ only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>QoS tab</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Enable QoS For This Traffic   | Enables Quality of Service (QoS) options for this traffic flow. When selected, the Enable Priority For This Flow and the Traffic Policing options become active.<br><br><b>Note</b> The options on this tab are applicable to PIX/ASA 7.0+ devices only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Priority For This Flow | Enables strict scheduling priority for this flow. The priority queues must be defined on the <a href="#">Priority Queues Page, page 56-4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Traffic Policing              | Enables output and input traffic policing. Traffic policing lets you control the maximum rate of traffic transmitted or received on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Output (Traffic Policing)     | Enables policing of traffic flowing out of the device. If you enable policing, you can specify the following values: <ul style="list-style-type: none"> <li>• <b>Committed Rate</b> – The rate limit for this traffic flow; this is a value in the range 8,000 to 2,000,000,000, specifying the maximum speed (bits per second) allowed.</li> <li>• <b>Burst Rate</b> – A value in the range 1,000 to 512,000,000 that specifies the maximum number of instantaneous bytes allowed in a sustained burst before throttling to the conforming rate value.</li> <li>• <b>Conform Action</b> – The action to take when the rate is less than the conform-burst value. Choices are Transmit or Drop.</li> <li>• <b>Exceed Action</b> – Take this action when the rate is between the conform-rate value and the conform-burst value. Choices are Transmit or Drop.</li> </ul> |

**Table 56-3 Insert/Edit Service Policy (MPC) Rule Wizard—Step 3. Configure the actions.**

## About IPS Modules on ASA Devices

You can install a variety of IPS modules, such as the Advanced Inspection and Prevention Security Services Module (AIP-SSM), in some ASA device models. The IPS modules supported by each ASA model differ. The IPS modules run advanced IPS software that provides proactive, full-featured intrusion prevention services to stop malicious traffic, including worms and network viruses, before they can affect your network.

The ASA IPS module runs separately from the adaptive security appliance, and you need to add it to the device inventory as a separate device. It is, however, integrated into the ASA traffic flow.

When you configure the ASA IPS module, you need to configure the service policy rules on the host ASA as well as the IPS policies on the IPS module. The service policy rules determine which traffic is inspected by the IPS module. For an overview of IPS policy configuration, see [Overview of IPS Configuration, page 35-5](#).

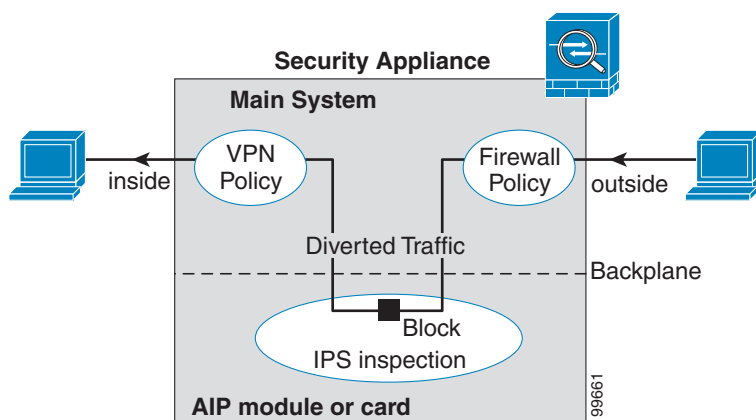

When you identify traffic for IPS inspection, the traffic flows through the ASA and the IPS module as follows:

1. Traffic enters the ASA.
2. Firewall policies, such as interface access rules, are applied.
3. Traffic is sent to the IPS module over the backplane when you operate in inline mode. If you configure the system to use promiscuous mode, a copy of the traffic is sent to the IPS module.

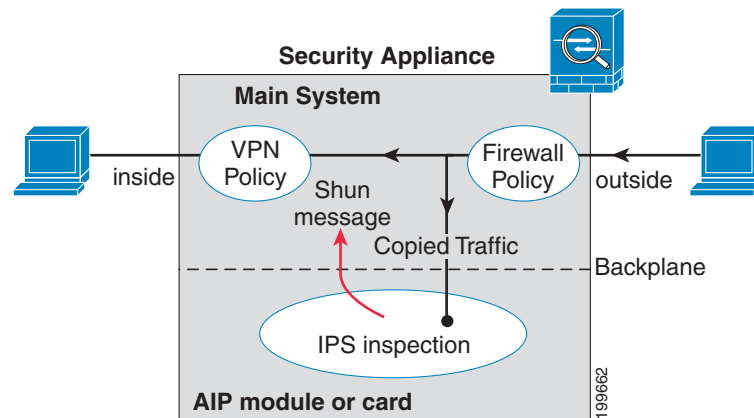

See **IPS Mode** in the Intrusion Prevention section of the Insert/Edit Service Policy (MPC) Rule wizard ([Step 3. Configure the MPC actions, page 56-8](#)) for more information about Inline and Promiscuous modes.

4. The IPS module applies its security policy to the traffic and takes appropriate actions.
5. Allowed traffic is sent back to the adaptive security appliance over the backplane. In Inline mode, the IPS module may block some traffic according to its security policy; in other words, that traffic is not passed back.
6. VPN policies are applied (if configured).
7. Traffic exits the ASA.

The following illustration depicts traffic flow when running the IPS module in Inline mode. In this example, the IPS module automatically blocks traffic that it identifies as an attack. All other traffic is returned to the ASA.

The next illustration depicts traffic flow when the IPS module is running in Promiscuous mode. In this example, the IPS module sends a shun message to the ASA for traffic it has identified as a threat.

## About the ASA CX

The ASA CX is a Security Services Processor (SSP) that can be installed in the Cisco ASA-5585-X series Adaptive Security Appliance. You configure the parent ASA to redirect traffic to the ASA CX, which then applies its security policies and either drops the traffic, or returns it to the ASA for further processing and routing to the next destination.

There are two basic policies that may need adjustment in the ASA when you add a ASA CX: access rules and inspection rules:

- Access rules, whether global rules or those applied to specific interfaces, are always applied before traffic is redirected to the ASA CX. Thus, the security card sees only the traffic already permitted, and does not process traffic that was dropped at entry to the ASA. Consider adjusting the rules to ensure that all traffic that you want the ASA CX to process is permitted.
- Inspection rules determine which traffic is inspected. The ASA CX does not inspect traffic that has already been inspected by the ASA. Therefore, you must ensure that you do not inspect traffic that you intend the ASA CX to inspect. Specifically, do not inspect HTTP traffic, because HTTP inspection is one of the core functions of the ASA CX. The default inspection rules on the ASA do not include HTTP inspection, so you must alter your inspection rules only if you added HTTP rules.

Determine if you need to create access rules for an interface, or global access rules that apply to all interfaces. Use the ASA access rules to filter traffic before it is redirected to the ASA CX. If you know there are classes of traffic that you never want to pass, it is more efficient to drop them immediately upon entry to the ASA.

If you have already established access rules, there is no requirement to change them. However, you should evaluate whether they need to be relaxed in order to have the ASA CX process certain types of traffic that you are now dropping by means of access rules.

Enabling traffic redirection to an installed ASA CX is described in [Step 3. Configure the MPC actions, page 56-8](#) of the [Insert/Edit Service Policy \(MPC\) Rule Wizard, page 56-6](#).

## ASA CX Auth Proxy Configuration

If you enabled ASA CX authentication proxy—on the **CXSC** tab during Step 3 of the Insert/Edit Service Policy (MPC) Rule Wizard; see [Step 3. Configure the MPC actions, page 56-8](#)—and you want to use a non-default port for active authentication, use the Add/Edit CXSC Auth Proxy Configuration dialog box to change the ASA CX Auth Proxy Port number.

If users must be prompted for authentication credentials, the prompting is done through this port.

**Note**

Security Manager uses “CXSC” in some places to refer to an ASA CX Security Services Processor (SSP).

**Navigation Path**

Open the Add/Edit CXSC Auth Proxy Configuration dialog box by clicking the **CXSC Auth Proxy** button below the rules table on the [IPS, QoS, and Connection Rules Page, page 56-5](#).

**Note**

The CXSC Auth Proxy button is available below the IPS, QoS, and Connection Rules table only in Device view; it is not visible in Policy view.

| Element              | Description                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| CXSC Auth Proxy Port | The default authentication proxy TCP port is 885; however, if you change it, you must enter a port number between 1024 and 65535. |

## Configuring Traffic Flow Objects

Use the Add and Edit Traffic Flow dialog boxes to configure traffic-match definitions. These traffic-flow definitions correspond to class maps (the **class map** command) in the IPS, QoS and Connection Rules service policy for devices running the PIX 7.0+, ASA 7.0+, and FWSM 3.2+ operating systems. For more information on configuring these rules, see [Chapter 56, “Configuring Service Policy Rules on Firewall Devices”](#).

**Navigation Path**

Select **Manage > Policy Objects**, then select **Traffic Flows** from the Object Type selector. Right-click inside the work area and choose New Object, or right-click a row and choose Edit Object.

These dialog boxes also can be opened by clicking the Create or Edit buttons in the Traffic Flows Selector while defining a Service Policy rule. See for [Step 2. Configure the traffic class, page 56-7](#) more information about selecting a Traffic Flow class.

| Name               | The name of the Traffic Flow object. A maximum of 40 characters is allowed. The name space for class maps is local to a security context. Therefore, the same name may be used in multiple security contexts. The maximum number of class maps per security context is 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description        | A description of the Traffic Flow (optional). A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Traffic Match Type | <p>The type of traffic to match. The option you choose may change the fields in the dialog box; all possible fields are explained later in this table. The Traffic Match Type options are:</p> <ul style="list-style-type: none"> <li>• Any Traffic – Matches all traffic.</li> <li>• Source and Destination IP Address (access-list) – Matches the source and destination IP addresses in a packet based on the access control list that you specify.</li> </ul> <p>For ASA 8.4(2+) devices, the ACL can include FQDN objects and user specifications to perform identity-based traffic matching.</p> <ul style="list-style-type: none"> <li>• Default Inspection Traffic – Matches default inspection traffic. For a list of default settings, see <a href="#">Default Inspection Traffic, page 56-18</a>.</li> <li>• Default Inspection Traffic with access list – Matches default inspection traffic limited by the access control list that you specify.</li> <li>• TCP or UDP Destination Port – Matches traffic to the TCP or UDP destination port or port range that you specify. Valid port numbers here are 0 to 65535.</li> <li>• RTP Range – Matches traffic to the range of UDP destination ports that you specify. Valid port numbers here are 2000 to 65535.</li> <li>• Tunnel Group – Matches the destination address based on flows in VPN tunnels belonging to a specified tunnel group.</li> <li>• IP Precedence Bits – Matches precedence values assigned to the traffic packets. You can select a maximum of four values.</li> <li>• IP DiffServe Code Points (DSCP) Values – Matches DSCP values associated with the traffic packets. You can select a maximum of eight values.</li> </ul> |

#### Variable Fields

The following fields may appear in the Add and Edit Traffic Flow dialog boxes, depending on your choice in the Traffic Match Type field. This list is the complete set of possible fields.

Table 56-5 Add and Edit Traffic Flow Dialog Boxes (Continued)

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available ACLs                                         | A list of the access control list (ACL) objects that you can select for the map. Select the ACL that defines the target traffic, or click the Create button to add a new object. You can also select an object and click Edit to change its definition. If the list of objects is large, use the Filter field to limit the display (see <a href="#">Filtering Items in Selectors, page 1-42</a> ).                                                                                                                             |
| TCP or UDP<br>TCP/UDP Port or Port Range               | Radio buttons used to specify a protocol (either TCP or UDP), and a text field used to specify a destination port number or range of numbers to use when matching traffic based on the specified protocol/ports.<br><br>You can specify a single port value, or a range of port numbers (for example, 0-2000). Valid port numbers are 0 to 65535.                                                                                                                                                                              |
| RTP Port Range                                         | The range of RTP destination ports associated with the traffic flow. You must enter a port range within the valid range of 2000 to 65535.<br><br><b>Note</b> When you close the dialog box, the port range you entered is converted to port-span values by subtracting the start value from the end value. For example, if you enter the range 2001-3000 in the dialog box, “RTP port 2001 range 999” appears in the Match Value column of the Traffic Flows policy object table. Port-span values are expected by the device. |
| Tunnel group name<br>Match Flow IP Destination Address | Lists available VPN tunnel groups. Choose one or enter the name of a group. You can also select Match Flow IP Destination Address to recognize the destination address as the match type.<br><br><b>Tip</b> You can use FlexConfig objects and policies to define a VPN tunnel group on a PIX 7.0+ device. For more information, see <a href="#">Understanding FlexConfig Policies and Policy Objects, page 7-2</a> .                                                                                                          |
| Available IP Precedence<br>Match on IP Precedence      | The IP precedence numbers. Select the values you want to match and click >> to add them to the Match table. Ctrl-click to select multiple values. You can select a maximum of four values.<br><br>To remove a value from the Match table, select it and click <<.                                                                                                                                                                                                                                                              |
| Available DSCP Values<br>Match on DSCP                 | The IP DiffServe Code Points (DSCP) numbers. Select the values you want to match and click >> to add them to the Match table. Ctrl-click to select multiple values. You can select a maximum of eight values.<br><br>To remove a value from the Match table, select it and click <<.                                                                                                                                                                                                                                           |
| Category                                               | The category assigned to the traffic-flow object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                         |

## Default Inspection Traffic

When you create a Traffic Flow policy object, you can choose to match the default inspection traffic. For more information, see [Configuring Traffic Flow Objects, page 56-16](#). The following table lists the types of traffic included in the Default Inspection Traffic category.

**Table 56-6** *Default Inspection Traffic*

| Value                                 | Port                        | NAT Limitations                                     | Comments                                                                                                                                                                                    |
|---------------------------------------|-----------------------------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CTIQBE                                | TCP/2748                    |                                                     |                                                                                                                                                                                             |
| CuSeeMe                               | UDP/7648                    |                                                     |                                                                                                                                                                                             |
| DNS over UDP                          | UDP/53                      | No NAT support for name resolution through WINS.    | No PTR records are changed.                                                                                                                                                                 |
| FTP                                   | TCP/21                      |                                                     |                                                                                                                                                                                             |
| GTP                                   | UDP/2123, 3386              |                                                     |                                                                                                                                                                                             |
| H.323, H.225                          | TCP/1720, 1718              | No NAT on same security interfaces. | SQL*Net                               | TCP/1521                    |                                                     | Versions 1 and 2.                                                                                                                                                                           |
| Sun RPC over UDP                      | UDP/111                     | No NAT or PAT.                                      | The default rule includes UDP port 111; if you want to enable Sun RPC inspection for TCP port 111, you need to create a new rule that matches TCP port 111 and performs Sun RPC inspection. |

**Table 56-6** Default Inspection Traffic (Continued)

| Value | Port    | NAT Limitations | Comments                                 |
|-------|---------|-----------------|------------------------------------------|
| TFTP  | UDP/69  |                 | Payload IP addresses are not translated. |
| XDMCP | UDP/177 | No NAT or PAT.  |                                          |

## Configuring TCP Maps

Use the Add and Edit TCP Map dialog boxes to define TCP normalization maps for use with IPS, QoS, and Connection Rules service policies. The TCP normalization feature lets you specify criteria that identify abnormal packets, which the security appliance drops when they are detected. The map is used for TCP traffic that passes through the device or that is going to the device.

These TCP maps can be applied to TCP flows on PIX 7.x+ and ASA devices. For more information on configuring IPS, QoS, and Connection Rules, see [Chapter 56, “Configuring Service Policy Rules on Firewall Devices”](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > TCP Maps** from the Object Type selector. Right-click inside the work area and choose New Object, or right-click a row and choose Edit Object.

These dialog boxes also can be opened by clicking the Create or Edit buttons in the TCP Maps Selector while defining a Service Policy rule. See the “Connection Settings” section of [Step 3. Configure the MPC actions, page 56-8](#) for more information about enabling TCP normalization and selecting a TCP map.

|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queue Limit<br>(ASA devices only)                 | <p>The maximum number of out-of-order packets that can be buffered and put in order for a TCP connection; enter a value between 1 and 250. Enter 0 to disable this setting and use the default system queue limit, which depends on the type of traffic:</p> <ul style="list-style-type: none"> <li>• Connections for application inspection, IPS, and TCP check-retransmission have a queue limit of 3 packets. If the security appliance receives a TCP packet with a different window size, then the queue limit is dynamically changed to match the advertised setting.</li> <li>• For other TCP connections, out-of-order packets are passed through untouched.</li> </ul> <p>However, if you set the Queue Limit to 1 or higher, the number of out-of-order packets allowed for all TCP traffic matches the specified value. For application inspection, IPS, and TCP check-retransmission traffic, any advertised settings are ignored. For other TCP traffic, out-of-order packets are now buffered and put in order instead of passed through untouched.</p> |
| Time Out<br>(ASA 7.2(4)+ devices only)            | <p>The maximum amount of time that out-of-order packets can remain in the buffer before they are dropped; enter a value between 1 and 20 seconds. The default is 4 seconds.</p> <p>This setting is ignored if you entered 0 for the Queue Limit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Verify TCP Checksum                               | If checked, checksum verification is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Drop SYN Packets with Data                        | If checked, TCP SYN packets that include data are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Drop Connection on Window Variation               | If checked, connections that change window size unexpectedly are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Drop Packets that Exceed Maximum Segment Size     | If checked, packets that exceed the maximum segment size (MSS) set by a peer are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check if Transmitted Data is the Same as Original | If checked, retransmit data checking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Clear Urgent Flag                                 | If checked, the URG (urgent) flag is cleared through the security appliance. The URG flag is used to indicate that the packet contains information that is of higher priority than other data within the stream. The TCP RFC is vague about the exact interpretation of the URG flag; therefore end systems handle urgent offsets in different ways, which may make the end system vulnerable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Clear Selective Ack                               | Whether the selective acknowledgment mechanism (SACK) option is cleared or allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Clear TCP Timestamp                               | Whether the timestamp option, which disables PAWS and RTT, is cleared or allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Clear Window Scale                                | Whether the window scale timestamp option is cleared or allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 56-7 Add and Edit TCP Map Dialog Boxes (Continued)**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable TTL Evasion Protection | <p>Enables the TTL evasion protection offered by the security appliance. Do not enable this option if you want to prevent attacks that attempt to evade security policy.</p> <p>For example, an attacker can send a packet that passes policy with a very short TTL. When the TTL goes to zero, a router between the security appliance and the endpoint drops the packet. It is at this point that the attacker can send a malicious packet with a long TTL that appears to the security appliance to be a retransmission and is passed. To the endpoint host, however, it is the first packet that has been received. In this case, an attacker is able to succeed without security preventing the attack.</p> |
| Reserved Bits                 | <p>Specify how to handle TCP packets with the reserved bits set in the TCP header. The six reserved bits in the TCP header are for future use and usually have a value of 0.</p> <ul style="list-style-type: none"> <li>• Clear and Allow—Clears the reserved bits in the TCP header and allows the packet.</li> <li>• Allow only—Permits packets with the reserved bits set in the TCP header.</li> <li>• Drop—Drops packets with the reserved bits set in the TCP header.</li> </ul>                                                                                                                                                                                                                           |
| TCP Range Options table       | <p>The TCP Range Options table lists TCP options ranges defined for the TCP map, and the action to take for those options. The typical range numbers are 6-7 and 9-255; the lower bound must be less than or equal to the upper bound.</p> <ul style="list-style-type: none"> <li>• To add a range, click the Add button to open the Add TCP Option Range dialog box (see <a href="#">Add and Edit TCP Option Range Dialog Boxes, page 56-22</a>).</li> <li>• To edit a range, select it and click the Edit button.</li> <li>• To delete a range, select it and click the Delete button.</li> </ul>                                                                                                              |
| Category                      | <p>The category assigned to the map object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Add and Edit TCP Option Range Dialog Boxes

Use the Add and Edit TCP Option Range dialog boxes to define or edit a range of TCP options for use with a TCP normalization map; these are TCP options not explicitly supported on the device. This feature lets you allow or discard packets with the specified TCP options set. The typical range numbers are 6-7 and 9-255.

### Navigation Path

In the Add and Edit TCP Map dialog boxes, right-click inside the TCP Range Options table and choose Add Row, or right-click an existing row and choose Edit Row. See [Configuring TCP Maps, page 56-20](#).

## Field Reference

Table 56-8 Add and Edit TCP Option Range Dialog Boxes

| Element | Description                                                                                                                                                                                                                                                                                                                                           |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lower   | The lower bound of the range; enter either 6 or 7, or an integer from 9 to 255.<br><b>Note</b> The Lower bound must be less than or equal to the Upper bound.                                                                                                                                                                                         |
| Upper   | The upper bound of the range; enter either 6 or 7, or an integer from 9 to 255.                                                                                                                                                                                                                                                                       |
| Action  | Choose the action to take for packets with the specified options set: <ul style="list-style-type: none"><li>• Allow – Allows any packet with a specified option set.</li><li>• Clear – Clears the specified option from any packet that has it set and allows the packet.</li><li>• Drop – Discards any packet with a specified option set.</li></ul> |

## Configuring Security Contexts on Firewall Devices

---

You can define multiple security “contexts” on a single security appliance. Each context operates as an independent virtual device, with its own security policy, interfaces and administrators. Multiple contexts are similar to having multiple stand-alone devices. Many features are supported in multiple-context mode, including routing tables, firewall features, IPS, and management. Some features are not supported; for example, VPN, multicast, and dynamic routing protocols; security contexts support only static routes; and you cannot enable OSPF or RIP in multiple-context mode. Also, some features are not directly managed by Cisco Security Manager, such as the IPS feature set for ASA and PIX devices.

In multiple-context mode, the security appliance includes a configuration for each context that identifies the security policy, interfaces, and most of the options you can configure on a stand-alone device. The system administrator adds and manages contexts by configuring them in the system configuration, which, like a single-mode configuration, is the start-up configuration. The system configuration identifies basic settings for the security appliance, but it does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses the context that is designated as the Admin context. The system configuration is used to add, delete and edit basic context settings, including allocating network interfaces to the various contexts.

The Admin context is just like any other context, except that when a user logs in to the Admin context, that user has system administrator rights and can access the system configuration and all other contexts.

This chapter contains the following topics:

- [Enabling and Disabling Multiple-Context Mode, page 57-1](#)
- [Checklist for Configuring Multiple Security Contexts, page 57-2](#)
- [Managing Security Contexts, page 57-4](#)

### Enabling and Disabling Multiple-Context Mode

Cisco Security Manager does not support switching to multiple-context mode on an existing device. To perform this task, you must delete the device from Security Manager, enable multiple-context mode using a device manager or CLI input, and then add the device again to Security Manager. After the device is added in multiple-context mode, you can add, edit and delete security contexts.

**Note**

When manually defining a multiple-context device, choose **Multi** from the Contexts list in the Operating System section of the New Device - Device Information dialog box.

Similarly, Cisco Security Manager does not support restoring an existing device to single-context mode. To perform this task, you must delete the device and any of its child contexts from Security Manager, restore single-context operation using a device manager or CLI input, and then add the device again to Security Manager.

**Note**

When manually defining a single-context device, choose **Single** from the Contexts list in the Operating System section of the New Device - Device Information dialog box.

## Checklist for Configuring Multiple Security Contexts

Security contexts allow a single physical device to act as multiple independent firewalls. Each security context defines a single virtual firewall, complete with its own configuration—and just as with physical devices, each security context must be correctly configured, or overall security can be compromised. Thus, defining and configuring multiple firewalls on the same physical appliance requires special care.

The following checklist outlines the basic steps necessary to configure a firewall device with multiple security contexts. Each of these steps may involve multiple substeps; all steps should be performed in the order presented. For example, you must define interfaces before configuring the various contexts.

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>Define interfaces and subinterfaces, or VLANs, on the physical appliance.</b></p> <p>In this task, you define the interfaces and subinterfaces, or VLANs on FWSMs, that will be allocated to the various security contexts when you create them later. Provide physical interface parameters, such as connection type (Ethernet, GigabitEthernet, etc.), hardware Port ID, speed, and duplex mode, as well as VLAN ID if defining a subinterface.</p> <p><b>Result:</b> All interfaces and subinterfaces are defined.</p> <p>For more information, see <a href="#">Configuring Firewall Device Interfaces, page 45-2</a>.</p> |

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p data-bbox="581 264 1422 296"><b>Define an Admin context for administering the base security appliance.</b></p> <p data-bbox="581 310 1511 436">This task is called out separately to ensure you define a context and IP address specifically for administration of the security appliance. The process is the same as defining a security context; however, during the process, be sure to check <b>Admin Context</b> to designate this as the administration context.</p> <p data-bbox="581 451 1503 577">In addition to being used to administer the appliance, the Admin context is used to publish syslog and SNMP messages to monitoring devices, such as the Cisco Security Monitoring, Analysis and Response System (CS-MARS), for further processing.</p> <p data-bbox="581 592 1511 718">Until you associate a specific management IP address with the Admin context, the IP address used to manage the security appliance is the one you specified when defining the device. When you specify a Management IP Address with the Admin context, it takes precedence over the one on the Device Properties page.</p> <p data-bbox="581 732 1458 764"><b>Result:</b> The Admin context is defined and associated with a physical interface.</p> <p data-bbox="581 779 878 810">For more information, see:</p> <ul data-bbox="594 825 1317 898" style="list-style-type: none"> <li>• <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA), page 57-7</a></li> <li>• <a href="#">Add/Edit Security Context Dialog Box (FWSM), page 57-5</a></li> </ul> |
| Step 3 | <p data-bbox="581 915 1414 947"><b>Define each security context, or virtual firewall, on the base appliance.</b></p> <p data-bbox="581 961 1503 1087">In this task, you define individual security contexts, naming each, assigning a location for its configuration files, and allocating interfaces. Each security context represents a virtual firewall, and its definition includes the interfaces and range of associated VLAN IDs that are under its control.</p> <p data-bbox="581 1102 1511 1186"><b>Note</b> While the Admin context can operate as a firewall device, it is typically used as such only in single-context mode. Therefore, security contexts are treated as separate entities in this checklist.</p> <p data-bbox="581 1222 1503 1306">You cannot add new interfaces or modify the hardware Port value when defining a security context—you simply select previously defined interfaces for allocation to the context.</p> <p data-bbox="581 1329 1511 1392"><b>Result:</b> Each security context is defined and associated with a physical interface; the VLANs on which the security context will inspect traffic are also specified.</p> <p data-bbox="581 1407 878 1438">For more information, see:</p> <ul data-bbox="594 1453 1317 1526" style="list-style-type: none"> <li>• <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA), page 57-7</a></li> <li>• <a href="#">Add/Edit Security Context Dialog Box (FWSM), page 57-5</a></li> </ul>                                                                                |

| Step   | Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>Submit/deploy to generate the virtual firewalls as children of the base appliance.</b></p> <p>You must create the desired contexts on the security appliance before you can begin defining the individual settings of each context. To create contexts on the appliance, you must define them, and then either submit changes in Workflow mode, or deploy the changes to the security appliance in non-Workflow mode.</p> <p>When you create a security context, a “virtual firewall device” appears beneath the original security appliance in the Device View. Each virtual device is indicated by a related device icon with a dotted outline, and its name is the base security appliance name, underscore (_), context name. For example, the virtual device <i>asaMultiRouted_admin</i> would represent the Admin context (named “admin”) on the security appliance named “asaMultiRouted.” Similarly, <i>asaMultiRouted_security1</i> would represent the security context “security1” on the same base appliance.</p> <p><b>Result:</b> Your changes are submitted or deployed (depending on the Workflow mode), which in turn creates the Admin and security contexts as children of the base security appliance.</p> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Workflow and Activities Overview, page 1-18</a></li> <li>• <a href="#">Submitting an Activity for Approval (Workflow Mode with Activity Approver), page 4-20</a></li> <li>• <a href="#">Working with Deployment and the Configuration Archive, page 8-26</a></li> </ul> |
| Step 5 | <p><b>Define additional settings for each security context.</b></p> <p>You can now complete the definition of each security context by selecting a virtual firewall device in the Device Selector and editing available policies, such as access rules, translation options and so on.</p> <p><b>Result:</b> Each security context is fully defined, ready to operate as a virtual firewall.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Managing Security Contexts

The Security Contexts page lists security contexts configured for the selected device. You can add, edit and delete security contexts for an ASA, PIX 7.0+, or FWSM device running in multiple-context mode from this page.

### Tip

Deleting a security context from an FWSM device removes the security context from the running configuration of the device, but it does not delete the associated configuration file. This can cause problems if you later add another security context with the same name as the one previously deleted. This is a known issue for FWSM and is not connected to the behavior of Security Manager. A work-around is to use the CLI to delete the configuration file from the device.

Remember, the security appliance must be in multiple-context mode in order for you to configure contexts using Security Manager. See [Enabling and Disabling Multiple-Context Mode, page 57-1](#) for more information.

Follow these steps to manage security contexts:

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager, page 5-28](#)).

**Step 2** Select the appliance you want to configure.

**Step 3** Select **Security Contexts** in the Device Policy selector to display the Security Contexts page.

**Note** The child contexts of a multiple-mode device are represented using a different icon than firewall devices in single mode.

**Step 4** Add, edit and delete contexts, as necessary:

- To define a new context, click the **Add Row** button at the bottom of the page to open the Add Security Context box.
- To edit an existing context, select the desired entry in the Security Contexts list and then click the **Edit Row** button at the bottom of the page to open the Edit Security Context dialog box.
- To delete an existing context, select the desired entry in the list and then click the **Delete Row** button.

**Note** Deleting a security context here will also cause the security context device to be removed from device inventory.

Confirm the deletion of the security context and corresponding security context device.

**Note** Except for the titles, the Add Security Context dialog box and the Edit Security Context dialog box are identical. For PIX/ASA devices, see [Add/Edit Security Context Dialog Box \(PIX/ASA\), page 57-7](#) for more information; for FWSMs, see [Add/Edit Security Context Dialog Box \(FWSM\), page 57-5](#) for more information.

## Add/Edit Security Context Dialog Box (FWSM)

The Add Security Context and Edit Security Context dialog boxes let you define and maintain contexts for the currently selected Firewall Service Module. (Except for their titles, the two dialog boxes are identical.)

Note that at least one security context must be designated as the Admin context.

### Caution

Security Manager does not support mapped (that is, “named” or “aliased”) interfaces for FWSMs. If you discover an FWSM with named interfaces and then change the related configuration, redeployment will fail. Replace any interface aliases with the appropriate VLAN IDs.

**Navigation Path**

You can access the Add Security Context and Edit Security Context dialog boxes from the Security Contexts page, as described in [Managing Security Contexts, page 57-4](#).

**Field Reference****Table 57-1 Add/Edit Security Context Dialog Box (FWSM)**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | <p>Enter a name of up to 32 characters for the context. The names <code>System</code> and <code>Null</code> (in any combination of upper- and lower-case letters) are reserved, and cannot be used.</p> <p><b>Note</b> While context names are case-sensitive on the device, they are not in Security Manager. That is, you cannot have two contexts with the same name but different capitalization in Security Manager.</p>                                                                                                                                                                                                                                                                                                                  |
| Mode (FWSM 3.1+)   | <p>Choose the mode, Router or Transparent, for this security context.</p> <p><b>Note</b> You cannot change the chosen mode in the Edit Security Context dialog box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Admin Context      | <p>Check this box if this context is to be the Admin context for this device.</p> <p><b>Note</b> The name of the Admin context for the device is displayed below the Security Contexts table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| VLAN IDs           | <p>Enter the VLANs assigned to this context. Use commas to separate multiple VLAN entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Config URL         | <p>Specify the context configuration location, as a URL-type address, by choosing a file-system protocol and then entering the path and name of the file to access for the context configuration.</p> <p>That is, choose a protocol type from the drop-down list, and then type the server name (for remote file systems), path, and file name in the related text field. For example, the combined URL for FTP has the following format: <code>ftp://server.example.com/configs/admin.cfg</code>.</p> <p>Available protocols are:</p> <ul style="list-style-type: none"> <li>• <code>disk:/</code></li> <li>• <code>ftp://</code></li> <li>• <code>http://</code></li> <li>• <code>https://</code></li> <li>• <code>tftp://</code></li> </ul> |
| Failover Group     | <p>If this context is part of an active/active failover configuration, choose the failover group to which this context belongs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description        | <p>Enter an optional description for the context.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Management IP Addr | <p>Enter or Select the IP address that Security Manager is to use for communications with this security context.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Add/Edit Security Context Dialog Box (PIX/ASA)

The Add Security Context and Edit Security Context dialog boxes let you define and maintain contexts for the currently selected PIX/ASA security appliance. (Except for their titles, the two dialog boxes are identical.)

Note that at least one security context must be designated as the Admin context.

### Navigation Path

You can access the Add Security Context and Edit Security Context dialog boxes from the Security Contexts page, as described in [Managing Security Contexts, page 57-4](#).

### Field Reference

**Table 57-2 Add/Edit Security Context Dialog Box (PIX/ASA)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Description     | Enter an optional description for the context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mode (ASA 9.0+) | <p>Choose the mode, Router or Transparent, for this security context.</p> <p><b>Note</b> You cannot change the chosen mode in the Edit Security Context dialog box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Admin Context   | <p>Check this box if this context is to be the Admin context for this device.</p> <p><b>Note</b> The name of the Admin context for the device is displayed below the Security Contexts table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Config URL      | <p>Specify the context configuration location, as a URL-type address, by choosing a file-system protocol and then entering the path and name of the file to access for the context configuration.</p> <p>That is, choose a protocol type from the drop-down list, and then type the server name (for remote file systems), path, and file name in the related text field. For example, the combined URL for FTP has the following format: <code>ftp://server.example.com/configs/admin.cfg</code>.</p> <p>Available protocols are:</p> <ul style="list-style-type: none"> <li>• <code>disk0:/</code></li> <li>• <code>disk1:/</code></li> <li>• <code>flash:/</code></li> <li>• <code>ftp://</code></li> <li>• <code>http://</code></li> <li>• <code>https://</code></li> <li>• <code>tftp://</code></li> </ul> |

**Table 57-2 Add/Edit Security Context Dialog Box (PIX/ASA) (Continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ScanSafe Settings     | To enable ScanSafe inspection in this context, select Enable ScanSafe Web Security. To override the license specified in the system configuration, enter a license ID in the License field; must be 32 hexadecimal characters. See <a href="#">Chapter 20, “Working with ScanSafe Web Security”</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Interfaces            | <p>This table lists the interfaces and subinterfaces allocated to this context, and their associated settings. These are the interfaces and subinterfaces for which the security context will inspect traffic.</p> <p>To add interfaces and subinterfaces to this context, click the Add Row button below the table to open the <a href="#">Allocate Interfaces Dialog Box (PIX/ASA only)</a>, page 57-8. You can allocate one or more interfaces, and optionally with each interface, one or a range of subinterfaces.</p> <p>To edit an allocation entry, select it and then click the Edit Row button below the table to open the Edit Interface dialog box. Note that you can edit only the Alias Name and the Show hardware properties option; you cannot change the interface/subinterface assignments. Refer to <a href="#">Allocate Interfaces Dialog Box (PIX/ASA only)</a>, page 57-8 for more information about these options.</p> <p>To remove an interface/subinterface allocation, select the appropriate row in this table and then click the Delete Row button below the table.</p> |
| Failover Group        | If this context is part of an active/active failover configuration, choose the failover group to which this context belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Management IP Address | Enter or Select the IP address that Security Manager is to use for communications with this security context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Allocate Interfaces Dialog Box (PIX/ASA only)

The Allocate Interfaces dialog box lets you assign an interface, and optionally one or a range of related subinterfaces, to a context, and set name-aliasing options.

### Navigation Path

You access the Allocate Interfaces dialog box from the Add Security Context and Edit Security Context dialog boxes. See [Add/Edit Security Context Dialog Box \(PIX/ASA\)](#), page 57-7 for more information.

| Element                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical Interface                  | <p>Choose a physical interface to assign to this context.</p> <p>In transparent firewall mode, you can assign only an interface that has not been allocated to another context. If you choose an interface already assigned to another context, you must also specify a subinterface.</p>                                                                                                                                                                     |
| Sub Interface ID From/To            | <p>Use these drop-down lists to specify a subinterface, or a range of subinterfaces; both lists present the subinterface IDs associated with the chosen Physical Interface.</p> <p>To specify a single subinterface, choose the desired ID from the first list. To specify a range, if available, choose the ending ID from the second list. (In transparent firewall mode, only subinterfaces that have not been allocated to other contexts are shown.)</p> |
| View Allocation button              | <p>Click this button to open the View Interface Allocation dialog box, which presents a read-only list of all physical interfaces defined on this device and the security contexts and failover groups associated with each. You can use this to quickly determine current allocations without closing the Allocate Interfaces dialog box.</p>                                                                                                                |
| Use aliased name in context         | <p>To enable name aliasing for this interface/subinterface, check <b>Use aliased names in the security context</b> and then enter an alias in the Alias Name field.</p> <p>The specified alias replaces the name of this physical interface or subinterface anywhere it would be displayed for this context—for example, the Hardware Port column on the Interfaces Page.</p>                                                                                 |
| Alias Name                          | <p>Enter the desired alias. An alias must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and underscores.</p>                                                                                                                                                                                                                                                                                         |
| Suffix Range From/To                | <p>If you specified a range of subinterfaces, these fields are available to let you specify numeric suffixes for their aliased name. The aliased name for each subinterface consists of its sequence number from this range appended to the Alias Name you provided in the previous field.</p> <p>These values default to the beginning and ending subinterface ID numbers, but you can enter any valid range of numbers.</p>                                 |
| Show hardware properties in context | <p>Select this option to allow the <b>show interface</b> CLI command to display of physical interface properties for the context even if you defined an alias. If not selected, the show interface output includes the aliased name.</p>                                                                                                                                                                                                                      |

## **PART 6**

### **Router and Switch Device Configuration**

## Managing Routers

---

Cisco Security Manager supports the management and configuration of security features and other platform-specific features on Cisco IOS access security routers. You configure these features in the form of policies, each of which defines a different aspect of the configuration of the router. For a detailed explanation of the policy paradigm used by Security Manager, see [Chapter 5, “Managing Policies”](#).

You can discover the configurations that are already defined on Cisco IOS routers. The discovery process imports the device configuration into Security Manager as policies and policy objects that you can then manage as required. For more information, see [Discovering Router Policies, page 58-3](#).

### Note

Security Manager supports Cisco IOS Software Releases 12.3 and higher. However, a limited number of policies are supported for routers running Cisco IOS Software Release 12.1 or 12.2. See [Configuring Routers Running IOS Software Releases 12.1 and 12.2, page 58-2](#).

By right-clicking a policy type in one of the policy selectors, you can assign a policy to a single router, share the policy among multiple routers, or unassign the policy from the device.

The following topics describe how to configure platform policies and interface policies on Cisco IOS routers:

- Interface polices:
  - [Basic Interface Settings on Cisco IOS Routers, page 59-1](#)
  - [Advanced Interface Settings on Cisco IOS Routers, page 59-13](#)
  - [IPS Module Interface Settings on Cisco IOS Routers, page 59-22](#)
  - [CEF Interface Settings on Cisco IOS Routers, page 59-24](#)
  - [Dialer Interfaces on Cisco IOS Routers, page 59-27](#)
  - [ADSL on Cisco IOS Routers, page 59-33](#)
  - [SHDSL on Cisco IOS Routers, page 59-40](#)
  - [PVCs on Cisco IOS Routers, page 59-46](#)
  - [PPP on Cisco IOS Routers, page 59-70](#)
- Device administration policies:
  - [AAA on Cisco IOS Routers, page 60-2](#)
  - [User Accounts and Device Credentials on Cisco IOS Routers, page 60-13](#)
  - [Bridging on Cisco IOS Routers, page 60-18](#)
  - [Time Zone Settings on Cisco IOS Routers, page 60-22](#)

- [CPU Utilization Settings on Cisco IOS Routers](#), page 60-25
- [HTTP and HTTPS on Cisco IOS Routers](#), page 60-28
- [Line Access on Cisco IOS Routers](#), page 60-35
- [Optional SSH Settings on Cisco IOS Routers](#), page 60-63
- [SNMP on Cisco IOS Routers](#), page 60-66

- Identity policies:
  - [802.1x on Cisco IOS Routers](#), page 61-1
  - [Network Admission Control on Cisco IOS Routers](#), page 61-8
- Logging policies:
  - [Logging on Cisco IOS Routers](#), page 62-1
- Quality of Service:
  - [Quality of Service on Cisco IOS Routers](#), page 63-1
- Routing policies:
  - [BGP Routing on Cisco IOS Routers](#), page 64-1
  - [EIGRP Routing on Cisco IOS Routers](#), page 64-8
  - [OSPF Routing on Cisco IOS Routers](#), page 64-19
  - [RIP Routing on Cisco IOS Routers](#), page 64-42
  - [Static Routing on Cisco IOS Routers](#), page 64-50

**Note**

---

The settings on the Policy Management page of the Security Manager Administration window determine which router platform policies can be managed with Security Manager. Any policy type that you do not select in this window does not appear on the configuration pages of Security Manager.

---

## Configuring Routers Running IOS Software Releases 12.1 and 12.2

Security Manager provides limited support for routers running Cisco IOS Software Releases 12.1 and 12.2 (with the exception of the ASR 1000 Series, which supports more features). You can configure the following policies on these routers:

- Access Rules (Layer 3 only). See [Chapter 16, “Managing Firewall Access Rules”](#).
- Access Rule Settings. See [Chapter 16, “Managing Firewall Access Rules”](#).
- Interfaces. See [Basic Interface Settings on Cisco IOS Routers](#), page 59-1.

- FlexConfigs. See [Chapter 7, “Managing FlexConfigs”](#).

All other policies require Cisco IOS Software Release 12.3 or higher. For more information about supported devices, see [Supported Devices and Software Versions for Cisco Security Manager](#).

## Discovering Router Policies

You can discover the configurations of your Cisco IOS routers and import these configurations as policies into Security Manager. This makes it possible to add existing devices and manage them with Security Manager without having to manually configure each device policy by policy. For more information, see [Adding Devices to the Device Inventory, page 3-6](#).

You can discover all Cisco IOS commands that can be configured with Security Manager. Discovery ignores unsupported commands, which means that they are left intact on the device even after subsequent deployments. Additionally, in cases where Security Manager can discover the command, but not all the subcommands and keywords related to that command, the unsupported elements are ignored and left intact on the device.

You can also rediscover the configurations of devices that you are already managing with Security Manager at any time. Be aware, however, that performing rediscovery overwrites the policies that you have defined in Security Manager, and is therefore not generally recommended. For more information, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

---

**Note**

We recommend that you perform deployment immediately after you discover the policies on a Cisco IOS router, *before* you make any changes to policies or unassign policies from the device. Otherwise, the changes that you configure in Security Manager might not be deployed to the device.

---

---

**Note**

If a policy that is not configured in Security Manager was configured on the device using an out-of-band method (such as the CLI) between the time of the first discovery and rediscovery, we recommend that you perform deployment immediately after rediscovery.

## Basic Interface Settings on Cisco IOS Routers

You typically add interfaces to Security Manager by performing discovery, as described in [Discovering Policies, page 5-12](#). After you have discovered the interfaces, you can modify the properties of each interface.

You can also use Security Manager to configure physical and virtual interfaces manually. This is useful when you modify interface configurations of existing devices, and makes it possible for you to configure all the interfaces of a device before you physically add the device to the network.

## Available Interface Types

Table 59-1 on page 59-2 describes the types of interfaces that can be configured on Cisco IOS routers.

**Table 59-1 Router Interface Types**

| Type             | Description                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Null             | Null interface.                                                                                                                                                                                                                                                                                                                    |
| Analysis-module  | A Fast Ethernet interface that connects to the internal interface on the Network Analysis Module (NAM).<br><b>Note</b> You cannot configure parameters such as speed and duplex mode for this type of interface.                                                                                                                   |
| Async            | Port line used as an asynchronous interface.                                                                                                                                                                                                                                                                                       |
| ATM              | ATM interface.                                                                                                                                                                                                                                                                                                                     |
| BRI              | ISDN BRI interface. This interface configuration propagates to each B channel. B channels cannot be configured individually.<br><b>Note</b> You must configure a dialer interface policy for calls to be placed on a BRI interface. For more information, see <a href="#">Dialer Interfaces on Cisco IOS Routers, page 59-27</a> . |
| BVI              | Bridge-group virtual interface. BVI interfaces are used to route traffic at Layer 3 to the interfaces in a bridge group.                                                                                                                                                                                                           |
| Content-engine   | Content engine (CE) network module interface.<br><b>Note</b> You cannot configure parameters such as speed and duplex mode for this type of interface. You cannot create subinterfaces for this type of interface.                                                                                                                 |
| Dialer           | Dialer interface.                                                                                                                                                                                                                                                                                                                  |
| Ethernet         | Ethernet IEEE 802.3 interface.                                                                                                                                                                                                                                                                                                     |
| Fast Ethernet    | 100-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                       |
| FDDI             | Fiber Distributed Data Interface.                                                                                                                                                                                                                                                                                                  |
| Gigabit Ethernet | 1000-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                      |
| Group-Async      | Master asynchronous interface. This interface type creates a single asynchronous interfaces to which other interfaces are associated. This one-to-many configuration enables you to configure all associated member interfaces by configuring the master interface.                                                                |
| HSSI             | High-Speed Serial Interface.                                                                                                                                                                                                                                                                                                       |

**Table 59-1 Router Interface Types (Continued)**

| Type                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loopback             | <p>A logical interface that emulates an interface that is always up. For example, having a loopback interface on the router prevents a loss of adjacency with neighboring OSPF routers if the physical interfaces on the router go down.</p> <p>The name of a loopback interface must end with a number ranging from 0-2147483647.</p> <p><b>Note</b> This interface type is supported on all platforms. You can create an unlimited number of loopback interfaces.</p> |
| Multilink            | Multilink interface. A logical interface used for multilink PPP (MLP).                                                                                                                                                                                                                                                                                                                                                                                                  |
| Port channel         | Port channel interface. This interface type enables you to bundle multiple point-to-point Fast Ethernet links into one logical link. It provides bidirectional bandwidth of up to 800 Mbps.                                                                                                                                                                                                                                                                             |
| POS                  | Packet OC-3 interface on the Packet-over-SONET (POS) interface processor.                                                                                                                                                                                                                                                                                                                                                                                               |
| PRI                  | ISDN PRI interface. Includes 23/30 B-channels and one D-channel.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Serial               | Serial interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Switch               | Switch interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Ten Gigabit Ethernet | 10000-Mbps Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Token Ring           | Token Ring interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Tunnel               | <p>Tunnel interface.</p> <p><b>Note</b> You can create an unlimited number of virtual, tunnel interfaces. Valid values range from 0-2147483647.</p>                                                                                                                                                                                                                                                                                                                     |
| VG-AnyLAN            | 100VG-AnyLAN port adapter.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| VLAN                 | Virtual LAN subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Virtual Template     | Virtual template interface. When a user dials in, a predefined configuration template is used to configure a virtual access interface; when the user is done, the virtual access interface goes down and the resources are freed for other dial-in uses.                                                                                                                                                                                                                |

## Defining Basic Router Interface Settings

When you define an interface or subinterface for a Cisco IOS router, you name it, specify how it is assigned an IP address, and optionally define other properties, such as the speed, maximum transmission unit (MTU), and the encapsulation type.

**Note**

Basic interface settings are always local to the device on which they are configured. You cannot share this policy with other devices. You can, however, share advanced interface settings. For more information, see [Advanced Interface Settings on Cisco IOS Routers, page 59-13](#).

**Related Topics**

- [Deleting a Cisco IOS Router Interface, page 59-6](#)

- 
- Step 1** In Device view, select **Interfaces > Interfaces** from the Policy selector. The [Router Interfaces Page, page 59-7](#) is displayed.
- Step 2** To add a new interface or subinterface, click the Add Row button to open the Create Router Interface dialog box.
- To edit an existing interface or subinterface, select it in the Interfaces table, and then click the Edit Row button to open the Edit Router Interface dialog box. Refer to [Create Router Interface Dialog Box, page 59-8](#) for descriptions of the fields in these dialog boxes.
- Step 3** Select **Enabled** to have Security Manager actively manage this interface or subinterface. If this option is deselected, the interface/subinterface definition is retained, but the interface/subinterface itself is disabled (or “shutdown”).
- Step 4** Choose **Interface** or **Subinterface** from the Type list.
- Step 5** If you are creating an interface, enter a name for the interface. You can click **Select** to open a dialog box that will help you generate a standard name based on interface type and details about the interface’s location, such as card, slot, and subinterface. For more information on using the dialog box to generate an interface name, see [Interface Auto Name Generator Dialog Box, page 59-12](#).

**Note**

When naming a BVI interface, use the bridge group number as the card number. Deployment will fail if you configure a BVI interface without configuring a corresponding bridge group.

- Step 6** If you are creating a subinterface, provide the following:
- Parent**—Choose the parent interface for this subinterface.
  - Subinterface ID**—Enter a number to identify the subinterface.

**Note**

Security Manager configures serial subinterfaces as point-to-point, not multipoint.

- Step 7** To specify a **Layer Type**, choose a Level 2 (data link) or Level 3 (network) option from this list.
- Step 8** Choose a method of **IP** address assignment for this interface/subinterface, then provide additional information, as required:
- **Static IP**—Provide an **IP Address** and **Subnet Mask**.
  - **DHCP**—No additional information is required.
  - **PPPoE**—No additional information is required.
  - **Unnumbered**—Provide the name of the interface from which an IP address is to be “borrowed.”

**Note**

Layer 2 interfaces do not support IP addresses.

**Step 9** Define additional properties of the interface/subinterface:

- Use the **Negotiation** check box to enable and disable auto-negotiation for the interface.  
Auto-negotiation detects the capabilities of remote devices and negotiates the best possible performance between the two devices. When Negotiation is enabled, the Fast Ethernet Duplex and Speed options are disabled.

---

**Note** Auto-negotiation is available only for Fast Ethernet and Gigabit Ethernet interfaces on ASR devices.

---

- Choose a transmission mode from the **Duplex** list. If you choose Auto, be sure the network device to which this interface is connected is set to automatically detect the transmission mode. (Auto is not available on ASRs; use auto-negotiation instead.)

---

**Note** You must configure a fixed speed to define the duplex value. Tunnel and loopback interfaces do not support this setting.

---

- Choose a transmission speed from the **Speed** list. If you choose Auto, be sure the network device to which this interface is connected is set to automatically detect the transmission speed. (Auto is not available on ASRs; use auto-negotiation instead.)
- Enter the maximum transmission unit (**MTU**), which defines the largest packet size, in bytes, that this interface can support.

---

**Note** Certain interface properties are set automatically, or are unavailable, depending on the interface type and the underlying port type. For example, the Speed options are available for Fast Ethernet and Gigabit Ethernet interfaces only.

---

**Step 10** Choose an encapsulation method from the **Encapsulation** list:

- **None**—No encapsulation; no additional parameters are required.
- (Ethernet subinterfaces only) **DOT1Q**—VLAN encapsulation, as defined by the IEEE 802.1Q standard. Provide the following VLAN parameters for this subinterface:
  - Enter a VLAN ID to associate with this subinterface.

---

**Note** All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.

---

- If you are defining the 802.1Q trunk interface, select Native VLAN.

---

**Tip** To configure DOT1Q encapsulation on an Ethernet interface without associating a VLAN with the subinterface, enter the **vlan-id dot1q** command using CLI commands or FlexConfigs. See [Understanding FlexConfig Policies and Policy Objects, page 7-2](#). Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.

---

- (Serial interfaces only) **Frame Relay**—IETF Frame Relay encapsulation. Provide a data-link connection identifier (DLCI) for the subinterface.

---

**Note** Frame relay must be configured on the parent interface.

---

---

**Note** IETF Frame Relay encapsulation provides interoperability between a Cisco IOS router and equipment from other vendors. To configure Cisco Frame Relay encapsulation, use CLI commands or FlexConfigs.

---

- Step 11** (Optional) Enter a description of up to 1024 characters for the interface.
- Step 12** Click **OK** to save the interface/subinterface definition and close the dialog box. The new interface is displayed on the Router Interfaces page. Subinterfaces are displayed beneath the parent interface.
- 

## Deleting a Cisco IOS Router Interface

Although you can delete the definition of a virtual interface at any time, use this option with great care. If the interface is included in any policy definitions that exist for this router, deleting the interface causes these policy definitions to fail when they are deployed to the device.

---

**Note** Deleting the basic interface definition does not delete any advanced settings that are configured under **Interface > Settings > Advanced Settings**. You must delete these advanced settings separately. If you fail to do so, deployment fails.

---

---

**Note** Deleting the definition of a physical interface from the Router Interfaces page does not remove the interface from the device. If you perform this operation by mistake, you can perform rediscovery to restore the definition to Security Manager. For more information, see [Discovering Policies on Devices Already in Security Manager, page 5-15](#).

---

- 
- Step 1** Click the **Device View** button on the toolbar.
- Step 2** Select a router from the Device selector.
- Step 3** Select **Interfaces > Interfaces** from the Policy selector. The Router Interfaces page is displayed. See [Table 59-2 on page 59-7](#) for an explanation of the fields on this page.
- Step 4** Select an interface from the table, then click the **Delete** button. The interface is deleted.
-

# Router Interfaces Page

Use the Router Interfaces page to view, create, edit, and delete interface definitions (physical and virtual) on a selected Cisco IOS router. The Router Interfaces page displays interfaces that were discovered by Security Manager as well as interfaces added manually after you added the device to the system.

## Note

Unlike other router policies, the Interfaces policy cannot be shared among multiple devices. The Advanced Settings policy, however, may be shared. See [Local Policies vs. Shared Policies, page 5-3](#).

For more information, see [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

## Navigation Path

Select a Cisco IOS router from the Device selector, then select **Interfaces > Interfaces** from the Policy selector.

**Table 59-2 Router Interfaces Page**

| Element         | Description                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Type  | The interface type. Subinterfaces are displayed indented beneath their parent interface.                                                   |
| Interface Name  | The name of the interface.                                                                                                                 |
| Enabled         | Indicates whether the interface is currently enabled (managed by Security Manager) or disabled (shutdown state).                           |
| IP Address      | The IP address of interfaces defined with a static address.                                                                                |
| IP Address Type | The type of IP address assigned to the interface—static, DHCP, PPPoE, or unnumbered. (IP address is defined by a selected interface role.) |
| Interface Role  | The interface roles that are assigned to the selected interface.                                                                           |
| Add button      | Opens the <a href="#">Create Router Interface Dialog Box, page 59-8</a> . From here you can create an interface on the selected router.    |
| Edit button     | Opens the <a href="#">Create Router Interface Dialog Box, page 59-8</a> . From here you can edit the selected interface.                   |
| Delete button   | Deletes the selected interfaces from the table. Ensure that the interface is not being used in any other policy before deleting it.        |

## Create Router Interface Dialog Box

Use the Create Router Interface dialog box to create and edit physical and virtual interfaces on the selected Cisco IOS router.

### Tip

Interface configuration is specific to the type of device. Many of the options on this page might be greyed out for specific device or interface types because they do not apply or they are not configurable.

### Navigation Path

Go to the [Router Interfaces Page, page 59-7](#), then click the **Add** or **Edit** button beneath the table.

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled         | Whether the interface is enabled (no shutdown). If you deselect this option, the interface is created in the configuration but it is shut down.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Type            | Specifies whether you are defining an interface or subinterface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Name            | <p>Applies only to interfaces.</p> <p>The name of the interface. Enter a name manually, or click <b>Select</b> to display a dialog box for generating a name automatically. See <a href="#">Interface Auto Name Generator Dialog Box, page 59-12</a>.</p> <p>Logical interfaces require a number after the name:</p> <ul style="list-style-type: none"> <li>• The range for dialer interfaces is 0-799.</li> <li>• The range for loopback interfaces is 0-2147483647.</li> <li>• The range for BVI interfaces is 1-255.</li> <li>• The only allowed value for null interfaces is 0.</li> </ul> |
| Parent          | <p>Applies only to subinterfaces.</p> <p>The parent interface of the subinterface. Choose the parent interface from this list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Subinterface ID | <p>Applies only to subinterfaces.</p> <p>The ID number of the subinterface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 59-3 Create Router Interface Dialog Box (Continued)

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP          | <p>The method of IP address assignment for the interface:</p> <ul style="list-style-type: none"> <li>• Static IP—Defines a static IP address and subnet mask for the interface. Enter this information in the fields that appear below the option.</li> </ul> <p><b>Note</b> You can define the mask using either dotted decimal (for example, 255.255.255.255) or CIDR notation (/32). See <a href="#">Contiguous and Discontiguous Network Masks for IPv4 Addresses</a>, page 6-75.</p> <ul style="list-style-type: none"> <li>• DHCP—The interface obtains its IP address dynamically from a DHCP server.</li> <li>• PPPoE—The router automatically negotiates its own registered IP address from a central server (via PPP/IPCP). The following interface types support PPPoE: <ul style="list-style-type: none"> <li>– Async</li> <li>– Serial</li> <li>– High-Speed Serial Interface (HSSI)</li> <li>– Dialer</li> <li>– BRI, PRI (ISDN)</li> <li>– Virtual template</li> <li>– Multilink</li> </ul> </li> <li>• Unnumbered—The interface obtains its IP address from a different interface on the device. Choose an interface from the Interface list. This option can be used with point-to-point interfaces only.</li> </ul> <p><b>Note</b> Layer 2 interfaces do not support IP addresses. Deployment fails if you define an IP address on a Layer 2 interface.</p> |
| Layer Type  | <p>The OSI layer at which the interface is defined:</p> <ul style="list-style-type: none"> <li>• Unknown—The layer is unknown.</li> <li>• Layer 2—The data link layer, which contains the protocols that control the physical layer (Layer 1) and how data is framed before being transmitted on the medium. Layer 2 is used for bridging and switching. Layer 2 interfaces do not have IP addresses.</li> <li>• Layer 3—The network layer, which is primarily responsible for the routing of data in packets across logical internetwork paths. This routing is accomplished through the use of IP addresses.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Negotiation | <p>Available on ASRs; applies to Fast Ethernet and Gigabit Ethernet interfaces only.</p> <p>Auto-negotiation detects the capabilities of remote devices and negotiates the best possible performance between the two devices. When Negotiation is enabled, the Duplex and Speed options are disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 59-3 Create Router Interface Dialog Box (Continued)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Duplex  | <p>The interface transmission mode:</p> <ul style="list-style-type: none"> <li>• None—The transmission mode is returned to its device-specific default setting.</li> <li>• Full—The interface transmits and receives at the same time (full duplex).</li> <li>• Half—The interface can transmit or receive, but not at the same time (half duplex). This is the default.</li> <li>• Auto—The router automatically detects and sets the appropriate transmission mode, either full or half duplex. Not available on ASRs; use auto-negotiation instead.</li> </ul> <p><b>Note</b> When using Auto mode, be sure that the port on the active network device to which you connect this interface is also set to automatically negotiate the transmission mode. Otherwise, select the appropriate fixed mode.</p> <p><b>Note</b> You can configure a duplex value only if you set the Speed to a fixed speed, not Auto.</p> <p><b>Note</b> This setting does not apply to serial, HSSI, ATM, PRI, DSL, tunnel, or loopback interfaces.</p> |
| Speed   | <p>Applies only to Fast Ethernet and Gigabit Ethernet interfaces.</p> <p>The speed of the interface:</p> <ul style="list-style-type: none"> <li>• None—The setting is not configurable on the device.</li> <li>• 10—10 megabits per second (10Base-T networks).</li> <li>• 100—100 megabits per second (100Base-T networks). This is the default for Fast Ethernet interfaces.</li> <li>• 1000—1000 megabits per second (Gigabit Ethernet networks). This is the default for Gigabit Ethernet interfaces.</li> <li>• Auto—The router automatically detects and sets appropriate interface speed. Not available on ASRs; use auto-negotiation.</li> </ul> <p><b>Note</b> When using Auto mode, be sure that the port on the active network device to which you connect this interface is also set to automatically negotiate the transmission speed. Otherwise, select the appropriate fixed speed.</p>                                                                                                                                 |
| MTU     | <p>The maximum transmission unit, which refers to the maximum packet size, in bytes, that this interface can handle.</p> <p>Valid values for serial, Ethernet, and Fast Ethernet interfaces range from 64 to 17940 bytes.</p> <p>Valid values for Gigabit Ethernet interfaces range from 1500 to 9216 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 59-3 Create Router Interface Dialog Box (Continued)**

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encapsulation | <p>The type of encapsulation performed by the interface:</p> <ul style="list-style-type: none"> <li>• None—No encapsulation.</li> <li>• DOT1Q—VLAN encapsulation, as defined by the IEEE 802.1Q standard. Applies only to Ethernet subinterfaces.</li> <li>• Frame Relay—IETF Frame Relay encapsulation. Applies only to serial interfaces (not serial subinterfaces).</li> </ul> <p><b>Note</b> IETF Frame Relay encapsulation provides interoperability between a Cisco IOS router and equipment from other vendors. To configure Cisco Frame Relay encapsulation, use CLI commands or FlexConfigs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VLAN ID       | <p>Applies only to subinterfaces with encapsulation type DOT1Q.</p> <p>The VLAN ID associated with this subinterface. The VLAN ID specifies where 802.1Q tagged packets are sent and received on this subinterface; without a VLAN ID, the subinterface cannot send or receive traffic. Valid values range from 1 to 4094.</p> <p><b>Note</b> All VLAN IDs must be unique among all subinterfaces configured on the same physical interface.</p> <p><b>Tip</b> To configure DOT1Q encapsulation on an Ethernet interface without associating the VLAN with a subinterface, enter the <b>vlan-id dot1q</b> command using CLI commands or FlexConfigs. See <a href="#">Understanding FlexConfig Policies and Policy Objects, page 7-2</a>. Configuring VLANs on the main interface increases the number of VLANs that can be configured on the router.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| Native VLAN   | <p>Applies only when the encapsulation type is DOT1Q and you are configuring a physical interface that is meant to serve as an 802.1Q trunk interface. Trunking is a way to carry traffic from several VLANs over a point-to-point link between two devices.</p> <p>When selected, the Native VLAN is associated with this interface, using the ID specified in the VLAN ID field. (If no VLAN ID is specified for the Native VLAN, the default is 1.) The native VLAN is the VLAN to which all untagged VLAN packets are logically assigned by default. This includes the management traffic associated with the VLAN. If no VLAN ID is defined, the default is 1.</p> <p>For example, if the VLAN ID of this interface is 1, all incoming untagged packets and packets with VLAN ID 1 are received on the main interface and not on a subinterface. Packets sent from the main interface are transmitted without an 802.1Q tag.</p> <p>When deselected, the Native VLAN is not associated with this interface.</p> <p><b>Note</b> The Native VLAN cannot be configured on a subinterface of the trunk interface. Be sure to configure the same Native VLAN value at both ends of the link; otherwise, traffic may be lost or sent to the wrong VLAN.</p> |

**Table 59-3** Create Router Interface Dialog Box (Continued)

| Element     | Description                                                                                                                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DLCI        | Applies only to serial subinterfaces with Frame Relay encapsulation.<br>Enter the data-link connection identifier to associate with the subinterface. Valid values range from 16 to 1007.<br><b>Note</b> Security Manager configures serial subinterfaces as point-to-point not multipoint. |
| Description | Additional information about the interface (up to 1024 characters).                                                                                                                                                                                                                         |
| Roles       | The interface roles assigned to this interface. A message is displayed if no roles have yet been assigned.                                                                                                                                                                                  |

## Interface Auto Name Generator Dialog Box

Use the Interface Auto Name Generator dialog box to have Security Manager generate a name for the interface based on the interface type and its location in the router or switch.

### Navigation Path

Go to the [Create Router Interface Dialog Box, page 59-8](#), select **Interface** from the Type list, then click **Select** in the Name field.

### Field Reference

**Table 59-4** Interface Auto Name Generator Dialog Box

| Element | Description                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | The type of interface. Your selection from this list forms the first part of the generated name, as displayed in the Result field. For more information, see <a href="#">Available Interface Types, page 59-2</a> .                                                                              |
| Card    | The card related to the interface.<br><b>Note</b> When defining a BVI interface, enter the number of the corresponding bridge group.                                                                                                                                                             |
| Slot    | The slot related to the interface.                                                                                                                                                                                                                                                               |
| Port    | The port related to the interface.<br><b>Note</b> The information you enter in these fields forms the remainder of the generated name, as displayed in the Result field.                                                                                                                         |
| Result  | The name generated by Security Manager from the information you entered for the interface type and location. The name displayed in this field is read-only.<br><b>Tip</b> After closing this dialog box, you can edit the generated name in the Create Router Interface dialog box, if required. |

# Advanced Interface Settings on Cisco IOS Routers

In addition to the basic interface definitions that you can define on the Interfaces page, Security Manager provides a method for defining selected advanced settings on interfaces that support those settings.

Unlike the basic interface settings defined on the Interface page, you can share an advanced settings policy with multiple devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-34](#).

You can define a variety of advanced settings on a selected interface, subinterface, or interface role, including:

- Cisco Discovery Protocol (CDP) settings.
- Internet Control Message Protocol (ICMP) settings.
- Directed broadcast settings.
- Load interval for determining the average load.
- Throughput delay for use by routing protocols.
- Configuring TCP maximum segment size.
- Helper addresses for forwarding UDP broadcasts. For more information on helper addresses, see [Understanding Helper Addresses, page 59-14](#).
- Enabling Maintenance Operation Protocol (MOP).
- Enabling virtual fragmentation reassembly (VFR).
- Enabling proxy ARP.
- Enabling NBAR protocol discovery.
- Enabling and configuring unicast reverse path forwarding (RFP).

**Tip**

You can define these settings for multiple interfaces on a device at once by choosing an interface role instead of a specific interface. For example, if you have defined an All-Ethernets interface role, you can define identical advanced settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects, page 6-67](#).

**Before You Begin**

- Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

**Step 1** Do one of the following:

- (Device view) Select **Interfaces > Settings > Advanced Settings** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Advanced Settings** from the Policy Type selector. Select an existing policy or create a new one.

The Advanced Interface Settings page is displayed (see [Advanced Interface Settings Page, page 59-15](#)).

**Step 2** Do one of the following:

- Click the **Add** button to add an interface or interface role to the table. In the Advanced Interface Settings dialog box, enter the name of the interface or interface role, or click **Select** to select an existing role or to create a new role.
- Select an existing entry in the table and click the **Edit** button to change its settings.

- Step 3** Configure the advanced settings required for the selected interface. For details about each setting, see [Advanced Interface Settings Dialog Box, page 59-16](#).
- Step 4** Click **OK** to save your definitions. Your definitions are displayed in the Advanced Interface Settings table.

## Understanding Helper Addresses

Network hosts occasionally use User Datagram Protocol (UDP) broadcasts to determine address, configuration, and name information. This presents a problem if the host is on a network segment that does not include the required server, as by default, routers do not forward UDP broadcasts beyond their subnet. You can remedy this situation by configuring the interface to forward certain classes of broadcasts to a helper address.

One common use of helper addresses is when the router acts as a relay agent for DHCP clients who need to contact a DHCP server located on a different subnet. The helper address can either represent a specific DHCP server or a network address for a segment containing multiple DHCP servers. You can also configure a helper address for each DHCP server.

In [Figure 59-1](#), hosts located on network 192.168.1.0 can use 10.44.23.7 as a helper address to forward UDP broadcasts to the other network, while hosts located on network 10.44.0.0 can use 192.168.1.19 as their helper address.

**Figure 59-1** *Helper Addresses*

[Table 59-5](#) on page 59-14 lists the default UDP services that can be forwarded to helper addresses.

**Table 59-5** *Default UDP Services Forwarded to Helper Addresses*

| Service           | Port |
|-------------------|------|
| BOOTP/DHCP Client | 68   |
| BOOTP/DHCP Server | 67   |

**Table 59-5** Default UDP Services Forwarded to Helper Addresses (Continued)

| Service                  | Port |
|--------------------------|------|
| DNS                      | 53   |
| NetBIOS datagram service | 138  |
| NetBIOS name service     | 137  |
| TACACS                   | 49   |
| TFTP                     | 69   |
| Time                     | 37   |

**Tip**

To forward additional UDP services, use the CLI or FlexConfigs to configure the `ip forward-protocol` command. Use the `no` form of this command to prevent the forwarding of any of the default services listed in [Table 59-5 on page 59-14](#).

All of the following conditions must be met in order for a UDP or IP packet to use helper addresses:

- The MAC address of the received frame must be an all-ones broadcast address (ffff.ffff.ffff).
- The IP destination address must be one of the following: all-ones broadcast (255.255.255.255), subnet broadcast for the receiving interface, or major-net broadcast for the receiving interface if the `no ip classless` command is also configured.
- The IP time-to-live (TTL) value must be at least 2.
- The IP protocol must be UDP (17).

## Advanced Interface Settings Page

Use the Advanced Interface Settings page to configure advanced interface definitions (physical and virtual) on a router. Examples of advanced settings include Cisco Discovery Protocol (CDP) settings, ICMP message settings, and virtual fragment reassembly settings. You can configure settings for specific interfaces or for interface roles. The columns in the table summarize the advanced settings for an entry and are explained in [Advanced Interface Settings Dialog Box, page 59-16](#).

To configure advanced settings:

- Click the **Add** button to add an interface or interface role to the table, and fill in the Advanced Interface Settings dialog box.
- Select an entry and click the **Edit** button to edit an existing entry.
- Select an entry and click the **Delete** button to delete it.

For more information, see [Advanced Interface Settings on Cisco IOS Routers, page 59-13](#).

**Navigation Path**

- (Device view) Select **Interfaces > Settings > Advanced Settings** from the Policy selector.

- (Policy view) Select **Router Interfaces > Settings > Advanced Settings** from the Policy Type selector. Right-click **Advanced Settings** to create a policy, or select an existing policy from the Shared Policy selector.

## Advanced Interface Settings Dialog Box

Use the Advanced Interface Settings dialog box to define a variety of advanced settings on a selected interface as described in the table below.

#### Navigation Path

Go to the [Advanced Interface Settings Page, page 59-15](#), then click the **Add** or **Edit** button beneath the table.

#### Field Reference

**Table 59-6**      *Advanced Interface Settings Dialog Box*

| Element       | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface     | The interface on which the advanced settings are defined. Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the you want is not listed, click the <b>Create</b> button to create it.<br><br><b>Note</b> The only advanced settings supported on Layer 2 interfaces are Max. Bandwidth, Load Interval, and CDP. |
| Max Bandwidth | The bandwidth value to communicate to higher-level protocols in kilobits per second (kbps). The value you define in this field is an informational parameter only; it does not affect the physical interface.                                                                                                                                          |

Table 59-6 Advanced Interface Settings Dialog Box (Continued)

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Load Interval            | <p>The length of time, in seconds, used to calculate the average load on the interface. Valid values range from 30 to 600 seconds, in multiples of 30 seconds. The default is 300 seconds (5 minutes). Load interval is not supported on subinterfaces.</p> <p>Modify the default to shorten the length of time over which load averages are computed. You can do this if you want load computations to be more reactive to short bursts of traffic.</p> <p>Load data is gathered every 5 seconds. This data is used to compute load statistics, including input/output rate in bits and packets per second, load, and reliability. Load data is computed using a weighted-average calculation in which recent load data has more weight in the computation than older load data.</p> <p><b>Tip</b> You can use this option to increase or decrease the likelihood of activating a backup interface; for example, a backup dial interface may be triggered by a sudden spike in the load on an active interface.</p>                  |
| TCP Maximum Segment Size | <p>The maximum segment size (MSS) of TCP SYN packets that pass through this interface. Valid values range from 500 to 1460 bytes. If you do not specify a value, the MSS is determined by the originating host.</p> <p>This option helps prevent TCP sessions from being dropped as they pass through the router. Use this option when the ICMP messages that perform auto-negotiation of TCP frame size are blocked (for example, by a firewall). We highly recommend using this option on the tunnel interfaces of DMVPN networks.</p> <p>For more information, see <i>TCP MSS Adjustment</i> at this URL:<br/> <a href="http://www.cisco.com/en/US/docs/ios/12_2t/12_2t4/feature/guide/ft_a_dmss.html">http://www.cisco.com/en/US/docs/ios/12_2t/12_2t4/feature/guide/ft_a_dmss.html</a></p> <p><b>Note</b> Typically, the optimum MSS is 1452 bytes. This value plus the 20-byte IP header, the 20-byte TCP header, and the 8-byte PPPoE header add up to a 1500-byte packet that matches the MTU size for the Ethernet link.</p> |
| Helper Addresses         | <p>The helper addresses that are used to forward User Datagram Protocol (UDP) broadcasts that are received on this interface. Enter one or more addresses or the names of the network/host objects, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p>By default, routers do not forward broadcasts outside of their subnet. Helper addresses provide a solution by enabling the router to forward certain types of UDP broadcasts as a unicast to an address on the destination subnet. For more information, see <a href="#">Understanding Helper Addresses</a>, page 59-14.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 59-6 Advanced Interface Settings Dialog Box (Continued)

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Throughput Delay        | <p>The expected delay for the interface in tens of microseconds (for example, 3000 translates to 30,000 microseconds). You can enter a value between 1 and 16777215, and the default varies by the type of interface.</p> <p>Higher-level protocols might use delay information to make operating decisions. For example, IGRP can use delay information to differentiate between a satellite link and a land link. This setting is for informational purposes only and does not affect the actual delay on the interface.</p>                                                                                                                                              |
| Cisco Discovery Protocol settings | <p>Settings related to the Cisco Discovery Protocol (CDP). CDP is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment including routers, access servers, bridges, and switches. It is primarily used to obtain protocol addresses of neighboring devices and to discover the platform of those devices. The options are:</p> <ul style="list-style-type: none"> <li>• Enable CDP—Whether to enable the Cisco Discovery Protocol (CDP) on this interface. You cannot enable CDP on ATM interfaces.</li> <li>• Log CDP Messages—On Ethernet interfaces, whether to log duplex mismatches for this interface.</li> </ul> |
| <b>ICMP Messages Settings</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Redirect Messages          | <p>Whether to enable the sending of Internet Control Message Protocol (ICMP) redirect messages if the device is forced to resend a packet through the same interface on which it was received to another device on the same subnet. Redirect messages are sent when the device wants to instruct the originator of the packet to remove it from the route and substitute a different device that offers a more direct path to the destination.</p>                                                                                                                                                                                                                          |
| Enable Unreachable Messages       | <p>Whether to enable the sending of ICMP unreachable messages. Unreachable messages are sent in two circumstances:</p> <ul style="list-style-type: none"> <li>• If the interface receives a nonbroadcast packet destined for itself that uses an unknown protocol, the interface sends an ICMP unreachable message to the source.</li> <li>• If the device receives a packet that it cannot deliver to its ultimate destination because it knows of no route to the destination address, it sends an ICMP host unreachable message to the originator of the packet.</li> </ul> <p><b>Note</b> This is the only advanced setting supported by the null0 interface.</p>       |
| Enable Mask Reply Messages        | <p>Whether to enable the sending of ICMP mask reply messages. Mask reply messages are sent in response to mask request messages, which are sent when a device needs to know the subnet mask for a particular subnetwork.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 59-6** *Advanced Interface Settings Dialog Box (Continued)*

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Additional Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Maintenance Operation Protocol (MOP) | Whether to enable MOP on the interface. You can use MOP for utility services such as uploading and downloading system software, remote testing, and problem diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Virtual Fragment Reassembly (VFR)    | Whether to enable virtual fragmentation reassembly (VFR) on this interface. VFR is a feature that enables the Cisco IOS Firewall to create dynamic ACLs that can protect the network from various fragmentation attacks. For more information, see <i>Virtual Fragmentation Reassembly</i> at this URL:<br><br><a href="http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_virt_frag_reasm_ps6441_TSD_Products_Configuration_Guide_Chapter.html">http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_virt_frag_reasm_ps6441_TSD_Products_Configuration_Guide_Chapter.html</a> |
| Enable Proxy ARP                            | Whether to enable proxy Address Resolution Protocol (ARP) on the interface. Proxy ARP, defined in RFC 1027, is the technique in which one host, usually a router, answers ARP requests intended for another machine, thereby accepting responsibility for routing packets to the real destination. Proxy ARP can help machines on a subnet reach remote subnets without configuring routing or a default gateway.                                                                                                                                                                                                            |
| Enable NBAR Protocol Discovery              | Whether to enable network-based application recognition (NBAR) on this interface to discover traffic and keep traffic statistics for all protocols known to NBAR. Protocol discovery provides a method to discover application protocols traversing an interface so that QoS policies can be developed and applied to them. For more information, go to:<br><br><a href="http://www.cisco.com/en/US/products/ps6616/products_qanda_item09186a00800a3ded.shtml">http://www.cisco.com/en/US/products/ps6616/products_qanda_item09186a00800a3ded.shtml</a>                                                                      |

Table 59-6 Advanced Interface Settings Dialog Box (Continued)

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Directed Broadcasts<br>ACL                     | <p>Whether to have directed broadcast packets “exploded” as a link-layer broadcast when this interface is directly connected to the destination subnet. When deselected, directed broadcast packets that are intended for the subnet to which this interface is directly connected are dropped rather than being broadcast. This is the default.</p> <p>An IP directed broadcast is an IP packet whose destination address is a valid broadcast address on a different subnet from the node on which it originated. In such cases, the packet is forwarded as if it was a unicast packet until it reaches its destination subnet.</p> <p>This option affects only the final transmission of the directed broadcast on its destination subnet; it does not affect the transit unicast routing of IP directed broadcasts.</p> <p>If you enable directed broadcasts, you can apply an ACL to determine which directed broadcasts are permitted to be broadcast on the destination subnet. All other directed broadcasts destined for the subnet to which this interface is directly connected are dropped. Enter the name of a standard or extended ACL object, or click <b>Select</b> to select an object from a list or to create a new object.</p> <p><b>Tip</b> Because directed broadcasts, and particularly ICMP directed broadcasts, have been abused by malicious persons, we recommend deselecting this option on interfaces where directed broadcasts are not needed. When you enable directed broadcasts, apply an ACL to restrict their use.</p> |
| <b>Unicast Reverse Path Forwarding (RFP) Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Unicast RFP                                    | <p>Whether to enable unicast reverse path forwarding (RFP) on the interface. When you enable Unicast RFP on an interface, the router examines all packets that are received on that interface. The router checks to make sure that the source address appears in the FIB, and takes action based on your unicast RFP settings. Use unicast RFP to mitigate problems caused by malformed or forged (spoofed) IP source addresses that pass through a router. Malformed or forged source addresses can indicate DoS attacks based on source IP address spoofing. For more information on unicast RFP, see the description of the <b>ip verify unicast source reachable-via</b> command in the <i>Cisco IOS Interface and Hardware Component Command Reference</i>.</p> <p>To enable unicast RFP, you must also globally enable Cisco Express Forwarding (CEF). For more information on CEF, see <a href="#">CEF Interface Settings on Cisco IOS Routers, page 59-24</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                            | <p>How strict to make unicast RFP:</p> <ul style="list-style-type: none"> <li>• <b>Loose Mode</b>—The default. Examines incoming packets to determine whether the source address is in the Forwarding Information Base (FIB) and permits the packet if the source is reachable through any interface on the router.</li> </ul> <p>Use loose mode on interfaces where asymmetric paths allow packets from valid source networks (networks contained in the FIB). For example, routers that are in the core of an ISP network have no guarantee that the best forwarding path out of the router will be the path selected for packets returning to the router.</p> <ul style="list-style-type: none"> <li>• <b>Strict Mode</b>—Examines incoming packets to determine whether the source address is in the FIB and permits the packet only if the source is reachable through the interface on which the packet was received.</li> </ul> <p>Use strict mode on interfaces where only one path allows packets from valid source networks (networks contained in the FIB). Also, use strict mode when a router has multiple paths to a given network as long as the valid networks are switched through the incoming interfaces. Packets for invalid networks are dropped. For example, routers at the edge of the network of an ISP are likely to have symmetrical reverse paths. Strict mode is also applicable in certain multihomed situations, provided that optional Border Gateway Protocol (BGP) attributes, such as weight and local preference, are used to achieve symmetric routing.</p> |
| Allow Use Of Default Route for RFP Verification | Whether to permit Unicast RFP to successfully match on prefixes that are known through the default route when determining whether to pass packets. Normally, sources found in the FIB but only by way of the default route are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Allow Self Ping                                 | <p>Whether to allow the router to ping its own interfaces. By default, when you enable Unicast RFP, packets that are generated by the router and destined to the router are dropped, thereby making certain troubleshooting and management tasks difficult to accomplish.</p> <p> <b>Caution</b> Allowing self-ping opens a potential denial of service (DoS) hole.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ACL<br>(For Unicast RFP)                        | If you enable unicast RFP, you can apply an ACL to refine how packets are handled when a reverse path is not found. If you specify an ACL, when (and only when) a packet fails the Unicast RFP check, the ACL is checked to determine whether the packet should be dropped (using a deny statement in the ACL) or forwarded (using a permit statement in the ACL). Enter the name of a standard or extended ACL object, or click <b>Select</b> to select an object from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# IPS Module Interface Settings on Cisco IOS Routers

On some routers, you can install IPS modules such as the Cisco Intrusion Prevention System Advanced Integration Module or Network Module. When installed and active, you must configure the IPS Module interface settings policy to define the following:

- The name of the interface between the module and the router.
- The failure mode of the module. If the module fails, you can configure it to allow all traffic or to deny all traffic.
- The router interfaces to monitor. You can name specific interfaces or use interface roles to cover more than one interface at a time. For example, if you have defined an All-Ethernets interface role, you can define identical monitoring settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects](#), page 6-67.

## Tip

After you have defined an IPS Module interface settings policy, you can share the policy and assign it to other devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager](#), page 5-34.

## Before You Begin

Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers](#), page 59-1.

**Step 1** Do one of the following:

- (Device view) Select **Interfaces > Settings > IPS Module** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > IPS Module** from the Policy Type selector. Select an existing policy or create a new one.

The IPS Module Interface Settings page is displayed. See [IPS Module Interface Settings Page](#), page 59-22 for an explanation of the fields on this page.

**Step 2** In the IPS Module Interface Settings fields, enter the name of the IPS interface (such as IDS-Sensor1/0) or click Select to select it from a list. Also determine whether you want to allow all traffic if the module fails (fail open) or to deny all traffic (fail closed).

**Step 3** Identify the router interfaces that the module should monitor. Click the **Add** button below the IPS Module Service Module Monitoring Settings table to add interfaces to the list, or select an interface and click the **Edit** button to change the settings for an existing interface. Use the IPS Monitoring Information dialog box to define the interface name or role, monitoring mode, and access list (if any). For more information, see [IPS Monitoring Information Dialog Box](#), page 59-23.

## IPS Module Interface Settings Page

Use the IPS Module Interface Settings page to define the settings on the Cisco Intrusion Prevention System Advanced Integration Module or Network Module. The module must be running IPS 6.0 or later. You can define the fail mode for the IPS interface, and the interfaces that the module should monitor. Configure this policy only if the router hosts an IPS module.

**Caution**

Cisco IOS IPS and the Cisco IPS module cannot be used together. Cisco IOS IPS must be disabled when the IPS module is installed.

**Navigation Path**

- (Device view) Select **Interfaces > Settings > IPS Module** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > IPS Module** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

| Interface Name                                      | The name of the IPS module interface. Enter the name or click <b>Select</b> to select the interface or interface role. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Fail Over Mode                                      | How the module should handle traffic inspection during a module failure, either to fail open (passing all traffic without inspection) or fail closed (dropping all traffic). The default is fail open.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IPS Module Service Module Monitoring Settings table | <p>The list of interfaces on the router that the IPS module should monitor.</p> <p>The table shows the name of the interface or interface role, whether monitoring is inline or promiscuous, and whether an ACL is used to filter traffic for inspection on the interface. Inline mode puts the IPS module directly into the traffic flow, allowing it to stop attacks by dropping malicious traffic before it reaches the intended target. In promiscuous mode, packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. If the ACL is matched, the matched traffic is not inspected.</p> <ul style="list-style-type: none"> <li>• To add an interface to the table, click the Add button and fill in the <a href="#">IPS Monitoring Information Dialog Box, page 59-23</a>.</li> <li>• To edit the settings for an interface, select it and click the Edit button.</li> <li>• To delete an interface, select it and click the Delete button.</li> </ul> |

## IPS Monitoring Information Dialog Box

Use the IPS Monitoring Information dialog box to add or edit the properties of interfaces to be monitored by the IPS module.

**Navigation Path**

Go to the [IPS Module Interface Settings Page, page 59-22](#), then click the **Add** or **Edit** button beneath the IPS Module Service Module Monitoring Settings table.

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name  | A name of the interface or interface role that the module should monitor. Enter the name or click <b>Select</b> to select the interface or interface role. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                                                       |
| Monitoring Mode | How the interface should be monitored: <ul style="list-style-type: none"> <li>• Inline mode—The IPS module is directly in the traffic flow, allowing it to stop attacks by dropping malicious traffic before it reaches the intended target.</li> <li>• Promiscuous mode—Packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet.</li> </ul> |
| Access List     | The name of the standard or extended access list policy object to use to filter traffic on this interface for inspection, if you want to apply one. A matched ACL causes traffic not to be inspected for that ACL. Click <b>Select</b> to select the ACL or to create a new one.                                                                                                                                         |

## CEP Interface Settings on Cisco IOS Routers

Cisco Express Forwarding (CEF) is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks, from those that carry small amounts of traffic to those that carry large amounts of traffic in complex patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions. CEF is enabled by default on most Cisco IOS routers.

Typically, you do not need to configure a CEF policy unless you want to enable CEF accounting so that you can view statistics with the **show ip cef** command on the router. You would also configure the policy if you want to disable CEF, or to configure non-default CEF behavior on specific interfaces, for example, to have CEF load balance based on packets rather than source-destination packet streams.

When configuring alternate CEF settings for interfaces, you can name specific interfaces or use interface roles to cover more than one interface at a time. For example, if you have defined an All-Ethernets interface role, you can define identical CEF settings for every Ethernet interface on the device with a single definition. See [Understanding Interface Role Objects, page 6-67](#).

**Tip**

After you have defined a CEF interface settings policy, you can share the policy and assign it to other devices. This provides a convenient method for configuring multiple devices with identical settings. See [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-34](#).

**Before You Begin**

Define basic interface settings. See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

**Step 1** Do one of the following:

- (Device view) Select **Interfaces > Settings > CEF** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > CEF** from the Policy Type selector. Select an existing policy or create a new one.

The CEF Interface Settings page is displayed. See [CEF Interface Settings Page, page 59-25](#) for an explanation of the fields on this page.

**Step 2** If you are enabling CEF, select the accounting options you desire.

**Step 3** If you want to configure non-default behavior for certain interfaces, add them to the CEF Interface Settings table. Click the **Add** button below the table to add interfaces to the list, or select an interface and click the **Edit** button to change the settings for an existing interface. For more information about the options, see [CEF Interface Settings Dialog Box, page 59-26](#).

## CEF Interface Settings Page

Use the CEF Interface Settings page to define the settings for Cisco Express Forwarding. CEF is an advanced Layer 3 IP switching technology that optimizes network performance and scalability for all kinds of networks, from those that carry small amounts of traffic to those that carry large amounts of traffic in complex patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions. CEF is enabled by default on most Cisco IOS routers.

**Navigation Path**

- (Device view) Select **Interfaces > Settings > CEF** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > CEF** from the Policy Type selector. Create a new policy or select an existing policy from the Shared Policy selector.

**Related Topics**

In per-packet load balancing, packets for a given source-destination pair can take different equal-cost routes, and thus reach their destination out of order.<br><br>The default is to balance the load based on the destination of the traffic. |

## Dialer Interfaces on Cisco IOS Routers

Before you can configure a dial backup policy for a site-to-site VPN (see [Configuring Dial Backup, page 24-39](#)), you must configure a dialer interface policy on the appropriate Cisco IOS router. The dialer interface policy uses dialer pools to associate the dialer interface used by dial backup with a physical BRI interface on the router. Each dialer interface is associated with a single dialer pool, which can contain one or more physical interfaces. Multiple dialer interfaces can reference the same dialer pool.

The following topics describe how to create dialer interfaces policies on Cisco IOS routers:

- [Defining Dialer Profiles, page 59-27](#)
- [Defining BRI Interface Properties, page 59-29](#)

### Defining Dialer Profiles

When you configure a dialer profile, you must select the interface or interface role representing the dialer interface and specify the number to be dialed. You must also assign a pool ID, which you use to reference this dialer interface when configuring the physical dialer interface. Additionally, you can modify the default timeout settings for the line.

**Note**

IP is the only protocol supported for dialer profiles by Security Manager.

**Note**

Authentication parameters for the dialer profile are defined in the PPP policy.

**Before You Begin**

Define the virtual and physical dialer interfaces on the router. See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

**Note**

In addition, you can optionally define interface roles for the virtual and physical dialer interfaces. See [Defining Dialer Profiles, page 59-27](#).

**Related Topics**

- [Defining BRI Interface Properties, page 59-29](#)
- [Dialer Interfaces on Cisco IOS Routers, page 59-27](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Select an existing policy or create a new one.
- The Dialer page is displayed. See [Table 59-11 on page 59-30](#) for a description of the fields on this page.
- Step 2** Select a dialer profile from the upper table on the Dialer Interfaces page, then click **Edit**, or click **Add** to create a profile. The Dialer Profile dialog box appears. See [Table 59-12 on page 59-31](#) for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role that represents the virtual dialer interface, or click **Select** to select an interface role object or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-70](#).
- Step 4** Enter a name for the dialer profile. Having a name makes it easier for you to assign the correct dialer pool to the physical interface. See [Defining BRI Interface Properties, page 59-29](#).
- 
-  **Tip** We recommend that you define a name that is logically associated with the site to which the dialer interface serves as a backup. For example, if the dialer interface is serving as a backup connection to the London site, define the name London for the dialer profile.
- 
- Step 5** Enter an ID number for the dialer pool to associate with this dialer interface. Each dialer interface is associated with a single pool. Multiple interfaces may, however, be associated with the same dialer pool.
- Step 6** Enter the number of the dialer group to assign to the dialer interface.
- Step 7** (Optional) In the Interesting Traffic ACL field, enter the name of the extended ACL object that defines which packets are permitted to initiate calls using this dialer profile, or click **Select** to select the object from a list or to create a new one. Use this option to limit the IP traffic that can make use of the dialer.
- Step 8** Enter the dialer string, which is the phone number of the remote side of the dialer interface connection.
- Step 9** (Optional) Modify the default timeout values (Idle Timeout and Fast Idle Timeout), if required.
- Step 10** Click **OK** to save your definitions locally on the client and close the dialog box. The dialer profile appears in the Dialer Profile table on the Dialer page.
-

## Defining BRI Interface Properties

You configure the properties of the physical BRI interfaces used for dialer interface policies by selecting the appropriate interface or interface role, defining the dialer pools to which the interface belongs, and defining the ISDN switch type. It is the dialer pool that connects the physical interface with the virtual dialer interface.

**Note**

To define other types of physical dialer interfaces, such as ATM and Ethernet, use FlexConfigs. For more information, see [Understanding FlexConfig Policies and Policy Objects, page 7-2](#).

**Before You Begin**

Define the virtual and physical dialer interfaces on the router. See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

**Note**

In addition, you can optionally define interface roles for the virtual and physical dialer interfaces. See [Creating Interface Role Objects, page 6-68](#).

**Related Topics**

- [Defining Dialer Profiles, page 59-27](#)
- [Dialer Interfaces on Cisco IOS Routers, page 59-27](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Select an existing policy or create a new one.
- The Dialer Interfaces page is displayed. See [Table 59-11 on page 59-30](#) for a description of the fields on this page.
- Step 2** Select a physical BRI interface from the Dialer Physical Interfaces table, then click **Edit**, or click **Add** to add an interface. The Dialer Physical Interface dialog box appears. See [Table 59-13 on page 59-32](#) for a description of the fields in this dialog box.
- Step 3** Enter the name of the interface or interface role that represents the physical dialer interface, or click **Select** to select an interface role object from a list or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-70](#).
- Step 4** Enter the names of the dialer pools to associate with the physical interface, or click **Select** to display a selector. Separate multiple entries with commas.
- Step 5** Select the ISDN switch type used by the physical interface. [Table 59-13 on page 59-32](#) describes the available switch types.
- Step 6** (Optional) If you selected the Basic-DMS-100, Basic-NI, or Basic-5ess switch type, enter up to two service provider identifiers (SPIDs).

**Note**

We recommend that you do not enter SPIDs for the Basic-5ess switch type, even though SPIDs are supported.

- Step 7** Click **OK** to save your definitions locally on the client and close the dialog box. The interface definition appears in the Dialer Physical Interfaces table on the Dialer Interface page.

## Dialer Policy Page

Use the Dialer page to define the relationship between physical Basic Rate Interface (BRI) and virtual dialer interfaces. You use these dialer interfaces when you configure the dial backup feature for site-to-site VPNs.

For more information, see [Dialer Interfaces on Cisco IOS Routers, page 59-27](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > Dialer** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > Dialer** from the Policy Type selector. Right-click **Dialer** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

**Table 59-12** *Dialer Profile Dialog Box*

| Element                             | Description                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                | A descriptive name for the dialer profile. This name enables you to assign the correct dialer pool to the physical interface. You can also use the profile name as a reference to the site to which this dialer interface serves as a backup.                                                                                    |
| Interface                           | The virtual dialer interface to associate with the dialer profile. Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                |
| Pool ID                             | The dialer pool ID. Each pool can contain multiple physical interfaces and can be associated with multiple dialer interfaces. Each dialer interface, however, is associated with only one pool.                                                                                                                                  |
| Group                               | The group ID, which identifies the dialer group that this dialer interface uses.                                                                                                                                                                                                                                                 |
| Interesting Traffic ACL             | The extended, numbered ACL that defines which packets are permitted to initiate calls using this dialer profile. The valid ACL number range is 100 to 199.<br><br>Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it. |
| Dialer String (Remote Phone Number) | The phone number of the destination that the dialer contacts.                                                                                                                                                                                                                                                                    |
| Idle Timeout                        | The default amount of idle time before an uncontested line is disconnected. The default is 120 seconds.                                                                                                                                                                                                                          |
| Fast Idle Timeout                   | The default amount of idle time before a contested line is disconnected. The default is 20 seconds.<br><br>Line contention occurs when a busy line is requested to send another packet to a different destination.                                                                                                               |

## Dialer Physical Interface Dialog Box

Use the Dialer Physical Interface dialog box to add or edit the properties that associate physical BRI interfaces with dialer interfaces.

### Note

Use FlexConfigs to define other types of physical dialer interfaces, such as ATM and Ethernet. For more information, see [Understanding FlexConfig Policies and Policy Objects, page 7-2](#).

### Navigation Path

Go to the [Dialer Policy Page, page 59-30](#), then click the **Add** or **Edit** button beneath the Dialer Physical Interfaces table.

| SPID1       | <p>Applies only when you select Basic-DMS-100, Basic-NI, or Basic-5ess as the switch type.</p> <p>The service provider identifier (SPID) for the ISDN service to which the interface subscribes. Some service providers in North America assign SPIDs to ISDN devices when you first subscribe to an ISDN service. If you are using a service provider that requires SPIDs, your ISDN device cannot place or receive calls until it sends a valid assigned SPID to the service provider when accessing the switch to initialize the connection.</p> <p>Valid SPIDs can contain up to 20 characters, including spaces and special characters.</p> <p><b>Note</b> We recommend that you do not enter a SPID for interfaces using the AT&amp;T 5ESS switch type, even though they are supported.</p>                                                                                                                                             |
| SPID2       | <p>Applies only when you select DMS-100 or NI as the switch type.</p> <p>The service provider identifier (SPID) for a second ISDN service to which the interface subscribes. Valid SPIDs can contain up to 20 alphanumeric characters (no spaces are permitted).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## ADSL on Cisco IOS Routers

Digital Subscriber Line (DSL) is a family of technologies that transports data over existing twisted-pair copper wire. DSL uses frequencies that are beyond the upper list used by POTS (plain old telephone service) to deliver broadband applications, such as multimedia and video, over the local loop (or *last mile*) that connects the telephone company's central office to customer sites.

Asymmetric Digital Subscriber Line (ADSL) is a form of DSL where the data flow downstream to customer sites is much greater than the data flow upstream to the central office (CO). This asymmetric setup is well-suited for applications where users typically download far more information than they send, such as web surfing, video-on-demand, and remote LAN access. With ADSL, the connection speed is related to the distance between the customer site and the digital subscriber line-access multiplexer (DSLAM) that aggregates the connections from multiple customer sites onto a high-speed line.

ADSL downstream rates range from 1.5 to 9 Mbps, whereas upstream bandwidth ranges from 16 to 640 kbps. ADSL transmissions work at distances up to 18,000 feet (5,488 meters) over a single copper twisted pair. Newer versions of ADSL technology, such as ADSL2 and ADSL2+, offer even higher data rates for short distances, as well as power management and realtime performance monitoring.

ATM is used in many ADSL implementations due to its small, fixed-length cell size, which makes it suitable for carrying time-critical traffic, such as voice and video, in conjunction with other traffic. You can use Security Manager to configure ATM over DSL on a Cisco IOS router. For more information about configuring ADSL policies in Security Manager, see [Defining ADSL Settings, page 59-35](#).

To configure ADSL in Security Manager, you must do the following:

1. Configure an ATM interface or subinterface. See [Defining Basic Router Interface Settings, page 59-3](#).
2. Configure ADSL settings on the ATM interface or subinterface. See [Defining ADSL Settings, page 59-35](#).
3. Configure PVCs on the ATM interface or subinterface. See [Defining ATM PVCs, page 59-50](#).

**Note**

If you perform discovery on the device, Security Manager populates the Interfaces policy with the ATM interface and subinterface and the ADSL policy with the ADSL settings for that interface. Any discovered PVCs are added to the PVC policy.

## Supported ADSL Operating Modes

[Table 59-14 on page 59-34](#) describes the operating modes that are supported on each ADSL interface card that can be configured with Security Manager.

**Table 59-14** *ADSL Cards and Supported DSL Operating Modes*

| ADSL Interface Card | Supported DSL Operating Modes          |
|---------------------|----------------------------------------|
| WIC-1ADSL           | auto, ansi-dmt, itu-dmt, splitterless  |
| WIC-1ADSL-I-DG      | auto, etsi, itu-dmt                    |
| WIC-1ADSL-DG        | auto, ansi-dmt, itu-dmt, splitterless  |
| HWIC-1ADSL          | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| HWIC-1ADSLI         | auto, etsi, itu-dmt, adsl2, adsl2+     |
| HWIC-ADSL-B/ST      | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| HWIC-ADSLI-B/ST     | auto, etsi, itu-dmt, adsl2, adsl2+     |

Table 59-15 on page 59-35 describes the operating modes that are supported on each ADSL device that can be configured with Security Manager.

**Table 59-15 Fixed ADSL Devices and Supported DSL Operating Modes**

| Device                          | Supported DSL Operating Modes          |
|---------------------------------|----------------------------------------|
| 857 Integrated Services Router  | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| 876 Integrated Services Router  | auto, etsi, itu-dmt, adsl2, adsl2+     |
| 877 Integrated Services Router  | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| 1801 Integrated Services Router | auto, ansi-dmt, itu-dmt, adsl2, adsl2+ |
| 1802 Integrated Services Router | auto, etsi, itu-dmt, adsl2, adsl2+     |

## Defining ADSL Settings

When you configure an ADSL definition in Security Manager, you must select the ATM interface on which ADSL is being defined. In addition, we highly recommend that you specify the router type or the type of WIC (WAN interface card) installed in the router. The validity of DSL policy definitions is highly dependent on the hardware. By specifying the hardware used by this policy, you enable Security Manager to properly validate the values you define and avoid deployment failures.

You can optionally specify the following parameters:

- The DSL operating mode.
- Whether to enable dynamic VC bandwidth adjustments when using Inverse Multiplexing over ATM (IMA).
- Whether certain interface cards should use a particular set of carrier tones.

Modular Cisco IOS routers may contain multiple interface cards, each of which contains a single ATM interface. You may define only one ADSL definition per interface.

#### Before You Begin

- Make sure that the device contains an ADSL ATM interface. See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

#### Related Topics

- [Supported ADSL Operating Modes, page 59-34](#)
- [ADSL on Cisco IOS Routers, page 59-33](#)
- [PVCs on Cisco IOS Routers, page 59-46](#)

**Step 1** Do one of the following:

- (Device view) Select **Interfaces > Settings > DSL > ADSL** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > DSL > ADSL** from the Policy Type selector. Select an existing policy or create a new one.

The ADSL page is displayed. See [Table 59-16 on page 59-37](#) for a description of the fields on this page.

- Step 2** Click the **Add** button beneath the table to display the ADSL Settings dialog box. See [Table 59-17 on page 59-38](#) for a description of the fields in this dialog box.
- Step 3** In the ATM Interface field, enter the name of the ATM interface or interface role on which you want to define ADSL settings, or click **Select** to select an interface role or create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-70](#).

**Note** The interface that you select must be physically present on the device; otherwise, deployment fails.

- Step 4** (Optional) Select the interface card type installed on the router.

**Note** When discovering from a live device, the correct interface card type is already displayed. If you did not perform discovery on a live device, or if Security Manager cannot detect the type of interface card installed on the device, this field displays “Unknown”.

- Step 5** (Optional) When using IMA groups, select the **Allow bandwidth change on ATM PVCs** check box to enable dynamic adjustments to VC bandwidth in response to changes in group bandwidth. If this check box is left deselected, you must make these adjustments manually.

- Step 6** (Optional) Specify the DSL operating mode for this ATM interface. See [Table 59-14 on page 59-34](#) for a list of the operating modes supported for each card type.

- Step 7** (Optional) Select the **Use low tone set** check box to have the interface card use carrier tones 29 through 48.

- Step 8** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the ADSL table.

**Note** To edit an ADSL definition, select it from the table, then click **Edit**. To remove an ADSL definition, select it, then click **Delete**.

- Step 9** Repeat [Step 2](#) through [Step 8](#) to define ADSL settings on additional ATM interfaces. Only one ADSL definition may be defined on an interface.

## ADSL Policy Page

Use the ADSL page to create, edit, and delete ADSL definitions on the ATM interfaces of the router. For more information, see [Defining ADSL Settings, page 59-35](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > DSL > ADSL** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > DSL > ADSL** from the Policy Type selector. Right-click **ADSL** to create a policy, or select an existing policy from the Shared Policy selector.

**Field Reference****Table 59-16** *ADSL Page*

| Element            | Description                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM Interface      | The ATM interface on which ADSL settings are defined.                                                                                                                             |
| Interface Card     | The type of device or ADSL interface card on which the ATM interface resides.                                                                                                     |
| Bandwidth Change   | Indicates whether the router makes dynamic adjustments to VC bandwidth as overall bandwidth changes. (This is relevant only when IMA groups are configured on the ATM interface.) |
| DSL Operating Mode | The DSL operating mode for this interface.                                                                                                                                        |
| Tone Low           | Indicates whether the interface is using the low tone set (carrier tones 29 through 48).                                                                                          |
| Add button         | Opens the <a href="#">ADSL Settings Dialog Box, page 59-37</a> . From here you can define the ADSL settings for a selected ATM interface.                                         |
| Edit button        | Opens the <a href="#">ADSL Settings Dialog Box, page 59-37</a> . From here you can edit the selected ADSL definition.                                                             |
| Delete button      | Deletes the selected ADSL definition from the table.                                                                                                                              |

## ADSL Settings Dialog Box

Use the ADSL Settings dialog box to configure ADSL settings on a selected ATM interface.

**Note**

When you configure ADSL settings, we highly recommend that you select the type of device or interface card on which the ATM interface is defined. ADSL settings are highly dependent on the hardware. Defining the hardware type in Security Manager enables proper validation of your configuration for a successful deployment to your devices.

**Navigation Path**

Go to the [ADSL Policy Page, page 59-36](#), then click the **Add** or **Edit** button beneath the table.

## SHDSL on Cisco IOS Routers

Digital Subscriber Line (DSL) is a family of technologies that transports data over existing twisted-pair copper wire. DSL uses frequencies that are beyond the upper list used by POTS (plain old telephone service) to deliver broadband applications, such as multimedia and video, over the local loop (or *last mile*) that connects the telephone company's central office to customer sites.

Based on the International Telecommunications Union (ITU) G.991.2 global industry standard, symmetric high-speed digital subscriber line (SHDSL) delivers symmetrical data rates from 192 up to 2.3 Mbps on a single wire pair. It transports many types of signals, such as T1, E1, ISDN, ATM, and IP. In addition, the G.SHDSL signal has a greater distance reach from the central office than ADSL and proprietary SDSL connections.

To configure SHDSL in Security Manager, do the following:

1. Configure the SHDSL controller. See [Defining SHDSL Controllers, page 59-40](#).
2. Deploy the SHDSL policy. If ATM mode is activated, the router creates an ATM interface that corresponds to the controller upon deployment. See [Working with Deployment and the Configuration Archive, page 8-26](#).
3. Rediscover the device to add the new ATM interface to Security Manager. See [Discovering Policies on Devices Already in Security Manager, page 5-15](#).
4. (Optional) Create one or more subinterfaces on the ATM interface. See [Defining Basic Router Interface Settings, page 59-3](#).
5. Configure PVCs on the ATM interface or subinterface. See [Defining ATM PVCs, page 59-50](#).

### Note

If you perform discovery on the device, Security Manager populates the SHDSL policy with the definition of the controller and the Interfaces policy with the ATM interface and subinterface. Any discovered PVCs are added to the PVC policy.

### Related Topics

- [PVCs on Cisco IOS Routers, page 59-46](#)

## Defining SHDSL Controllers

When you configure an SHDSL controller in Security Manager, you must enter the name of the controller that is installed in the Cisco IOS router. The following settings are then applied automatically:

- ATM mode is enabled.
- The line termination is set to CPE (customer premises equipment).
- The line mode is set to Auto.

You can optionally change the line termination to CO and specify the DSL mode and line mode. In addition, you can define signal-to-noise ratio margins to improve line stability.

A Cisco IOS router may contain multiple SHDSL controllers. You may define only one SHDSL definition per controller.

**Note**

When you deploy an SHDSL policy with ATM mode enabled, an ATM interface is created automatically on the router. Perform rediscovery to add the interface into Security Manager. You can then define PVCs on the ATM interface as required. See [Defining ATM PVCs, page 59-50](#).

**Before You Begin**

- Make sure that an SHDSL controller is installed on the device.

**Related Topics**

- [SHDSL on Cisco IOS Routers, page 59-40](#)
- [PVCs on Cisco IOS Routers, page 59-46](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Interfaces > Settings > DSL > SHDSL** from the Policy selector.
  - (Policy view) Select **Router Interfaces > Settings > DSL > SHDSL** from the Policy Type selector. Select an existing policy or create a new one.
- The SHDSL page is displayed. See [Table 59-18 on page 59-42](#) for a description of the fields on this page.
- Step 2** Click the **Add** button beneath the table to display the SHDSL dialog box.
- Step 3** Enter the name of the controller, or click **Select** to display the utility for generating the name. See [Controller Auto Name Generator Dialog Box, page 59-45](#).

**Note**

The controller that you select must be physically present on the device; otherwise, deployment fails.

- Step 4** Define the SHDSL controller as required. For more information, see [Table 59-19 on page 59-43](#).
- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the SHDSL table.

**Note**

To edit an SHDSL controller, select it from the table, then click **Edit**. To remove an SHDSL controller, select it, then click **Delete**.

- Step 6** Repeat [Step 2](#) through [Step 5](#) to define additional SHDSL controllers. Only one definition may be defined per controller.

## SHDSL Policy Page

Use the SHDSL page to create, edit, and delete DSL controller definitions on the router. For more information, see [Defining SHDSL Controllers, page 59-40](#).

**Navigation Path**

- (Device view) Select **Interfaces > Settings > DSL > SHDSL** from the Policy selector.

- (Policy view) Select **Router Interfaces > Settings > DSL > SHDSL** from the Policy Type selector. Right-click **SHDSL** to create a policy, or select an existing policy from the Shared Policy selector.

| Element            | Description                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | The name of the DSL controller.                                                                                                                      |
| Description        | An optional description of the controller.                                                                                                           |
| Shutdown           | Indicates whether the DSL controller is in shutdown mode.                                                                                            |
| Configure ATM Mode | Indicates whether the DSL controller has been set into ATM mode.                                                                                     |
| Line Termination   | The line termination set for the router (CPE or CO).                                                                                                 |
| DSL Mode           | The operating mode defined for the DSL controller.                                                                                                   |
| Line Mode          | The line mode defined for the DSL controller.                                                                                                        |
| Line Rate          | The line rate (in kbps) defined for the DSL controller.<br><b>Note</b> A value is displayed in this column only if the line mode is not set to Auto. |
| SNR Margin Current | The current signal-to-noise ratio on the controller.                                                                                                 |
| SNR Margin Snext   | The self near-end crosstalk (Snext) signal-to-noise ratio on the controller.                                                                         |
| Add button         | Opens the <a href="#">SHDSL Controller Dialog Box, page 59-42</a> . From here you can define the settings for a DSL controller.                      |
| Edit button        | Opens the <a href="#">SHDSL Controller Dialog Box, page 59-42</a> . From here you can edit the selected DSL controller definition.                   |
| Delete button      | Deletes the selected DSL controller definition from the table.                                                                                       |

## SHDSL Controller Dialog Box

Use the SHDSL Controller dialog box to configure SHDSL controllers.

#### Navigation Path

Go to the [SHDSL Policy Page, page 59-41](#), then click the **Add** or **Edit** button beneath the table.

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | The name of the controller. Enter a name manually, or click <b>Select</b> to display a dialog box for generating a name. See <a href="#">Controller Auto Name Generator Dialog Box, page 59-45</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description        | Additional information about the controller (up to 80 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Shutdown           | When selected, the DSL controller is in shutdown state. However, its definition is not deleted.<br>When deselected, the DSL controller is enabled. This is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Configure ATM mode | When selected, sets the controller into ATM mode and creates an ATM interface with the same ID as the controller. This is the default. You must enable ATM mode and then perform rediscovery to configure ATM or PVCs on the device.<br>When deselected, ATM mode is disabled. No ATM interface is created on deployment.<br><b>Note</b> You cannot remove ATM mode from a controller after it has been saved in Security Manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Line Termination   | The line termination that is set for the router: <ul style="list-style-type: none"> <li>• CPE—Customer premises equipment. This is the default.</li> <li>• CO—Central office.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DSL Mode           | The DSL operating mode, including regional operating parameters, used by the controller: <ul style="list-style-type: none"> <li>• [blank]—The operating mode is not defined. (When deployed, the Annex A standard for North America is used.)</li> <li>• A—Supports Annex A of the G.991.2 standard for North America.</li> <li>• A-B—Supports Annex A or Annex B. Available only when the Line Term is set to CPE. The appropriate mode is selected when the line trains.</li> <li>• A-B-ANFP—Supports Annex A or Annex B-ANFP. Available only when the Line Term is set to CPE. The appropriate mode is selected when the line trains.</li> <li>• B—Supports Annex B of the G.991.2 standard for Europe.</li> <li>• B-ANFP—Supports Annex B-ANFP (Access Network Frequency Plan).</li> </ul> <b>Note</b> The available DSL modes are dependent on the selected line termination. |

Line Mode settings

| Result  | The name generated by Security Manager from the information you entered for the controller location. The name displayed in this field is read-only.<br><br><b>Tip</b> After closing this dialog box, you can edit the generated name in the SHDSL dialog box, if required. |

## PVCs on Cisco IOS Routers

Asynchronous Transfer Mode (ATM) is an International Telecommunication Union (ITU-T) standard designed for the high-speed transfer of voice, video, and data through public and private networks using cell relay technology. A cell switching and multiplexing technology, ATM combines the benefits of circuit switching (constant transmission delay, guaranteed capacity) with those of packet switching (flexibility, efficiency for intermittent traffic). An ATM network is made up of one or more ATM switches and ATM endpoints, such as a Cisco IOS router.

There are three general types of ATM services, permanent virtual connections (PVCs), switched virtual connections (SVCs), and connectionless service. PVCs allow direct and permanent connections between sites to provide a service that is similar to a leased line. Advantages of PVCs are the guaranteed availability of a connection and that no call setup procedures are required between switches. Each piece of equipment between the source and destination must be manually provisioned for the PVC.

For more information about ATM PVCs, see:

- [Understanding Virtual Paths and Virtual Channels, page 59-46](#)
- [Understanding ATM Service Classes, page 59-47](#)
- [Understanding ATM Management Protocols, page 59-48](#)

For more information about defining PVCs in Security Manager, see:

- [Defining ATM PVCs, page 59-50](#)
- [Defining OAM Management on ATM PVCs, page 59-53](#)

## Understanding Virtual Paths and Virtual Channels

ATM networks are fundamentally connection oriented. This means that a virtual connection needs to be established across the ATM network before any data transfer. Two types of ATM connections exist:

- Virtual path connections (VPCs), identified by a virtual path identifier (VPI).
- Virtual channel connections (VCCs), identified by the combination of a VPI and a VCI (virtual channel identifier). PVCs are a type of VCC where a permanent connection is defined between two sites.

As shown in Figure 59-2, a virtual path is a bundle of virtual channels, all of which are switched transparently across the ATM network on the basis of the common VPI. A VPC can be thought of as a bundle of VCCs with the same VPI value.

**Figure 59-2** ATM Virtual Path and Virtual Channel Connections

Every cell header contains a VPI field and a VCI field, which explicitly associate a cell with a given virtual channel on a physical link. It is important to remember the following attributes of VPIs and VCIs:

- VPIs and VCIs are not addresses, such as MAC addresses used in LAN switching.
- VPIs and VCIs are explicitly assigned at each segment of a connection and, as such, have only local significance across a particular link. They are remapped, as appropriate, at each switching point.

Using the VPI/VCI identifier, the ATM layer can multiplex (interleave), demultiplex, and switch cells from multiple connections. Certain VPI/VCI identifiers are reserved for particular uses, such as the Integrated Local Management Interface (ILMI).

## Understanding ATM Service Classes

Version 4.0 of the Traffic Management Specification published by the ATM Forum defines five service classes that describe the user traffic transmitted on a network and the quality of service that a network needs to provide for that traffic. Security Manager supports the following ATM service classes:

- *Available Bit Rate (ABR)* This is a service class where ATM switches make no guarantee of cell delivery, but do guarantee a minimum bit rate and that cell loss is kept as low as possible with the use of a feedback mechanism. The ABR service category is designed for VCs that carry file transfers and other bursty, non-real-time traffic that requires a minimum amount of bandwidth. This bandwidth is specified via a minimum cell rate that must be available while the VC is configured and active. For more details, see *Understanding the Available Bit Rate (ABR) Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a00800fbc76.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a00800fbc76.shtml).
- *Constant Bit Rate (CBR)* This is a service class where cells are transmitted in a continuous bitstream to meet voice and video QoS needs. The CBR service class is designed for ATM virtual circuits (VCs) that need a static amount of bandwidth that is continuously available for the duration of the active connection. An ATM VC configured as CBR can send cells at peak cell rate (PCR) at any time and for any duration. It also can send cells at a rate less than the PCR or even emit no cells. The

configuration on CBR may vary with different platforms. For more details, see *Understanding the CBR Service Category for ATM VCs* at:

[http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094e6a.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094e6a.shtml).

- *Unspecified Bit Rate (UBR)* This is a service class where the network management makes no Quality of Service (QoS) commitment. It models the best-effort service that the Internet normally provides and is suitable for applications tolerant to delay that do not require real-time responses. Examples include email, fax transmission, file transfers, Telnet, LAN and remote office interconnections. For more details, see *Understanding the UBR Service Category for ATM Virtual Circuits* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a00800a4837.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a00800a4837.shtml).
- *Unspecified Bit Rate (UBR+)* Cisco provides a variant of the UBR service class called UBR+. The main advantage of the UBR+ service class is that it allows an ATM end-system to signal a minimum cell rate to an ATM switch in a connection request, and the ATM network attempts to maintain this minimum as an end-to-end guarantee. For more details, see *Understanding the UBR+ Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094b40.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094b40.shtml).
- *Variable Bit Rate - Non-Real Time (VBR-nrt)* This service class is used to transmit non-real-time applications that are bursty in nature. The traffic characteristics are defined in terms of the Peak Cell Rate (PCR), Sustained Cell Rate (SCR), and Minimum Burst Size (MBS). For more details, see *Understanding the VBR-nrt Service Category and Traffic Shaping for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080102a42.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080102a42.shtml).
- *Variable Bit Rate - Real Time (VBR-rt)* This service class is used to transmit real-time data that is sensitive to time delays, like compressed voice over IP and video conferencing. As with VBR-nrt, VBR-rt traffic is defined in terms of a PCR, SCR, and MBS. For more details, see *Understanding the Variable Bit Rate Real Time (VBR-rt) Service Category for ATM VCs* at: [http://www.cisco.com/en/US/tech/tk39/tk51/technologies\\_tech\\_note09186a0080094cd0.shtml](http://www.cisco.com/en/US/tech/tk39/tk51/technologies_tech_note09186a0080094cd0.shtml).

You can use these service classes to define ATM quality of service (QoS) guarantees, such as traffic shaping. Traffic shaping is the use of queues to constrain data bursts, limit peak data rate, and smooth jitter so that traffic fits within the envelope defined by the traffic contract. ATM devices use traffic shaping to adhere to the terms of the traffic contract.

## Understanding ATM Management Protocols

ATM uses two different types of signaling for tracking the status of PVCs:

- Integrated Local Management Interface (ILMI). For more information, see [Understanding ILMI, page 59-49](#).
- Flow 4 (F4) and Flow 5 (F5) Operation, Administration, and Maintenance (OAM) cells. For more information, see [Understanding OAM, page 59-50](#).

Security Manager can be used to enable and disable ILMI on specific PVCs and to configure F5 OAM functionality.

## Understanding ILMI

The Integrated Local Management Interface (ILMI) is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. ILMI facilitates network-wide autoconfiguration by enabling devices to determine the status of components at the other end of a physical link and to negotiate a common set of operational parameters to ensure interoperability. The ATM routing protocols, PNNI (Private Network to Network Interface) and IISP (Interim-Interswitch Signaling Protocol), use this information to discover and bring up a network of interconnected ATM switch routers.

When two ATM interfaces run the ILMI protocol, they exchange ILMI packets across the physical connection. These packets consist of SNMP messages as large as 484 octets. ATM interfaces encapsulate these messages in an ATM adaptation layer 5 (AAL5) trailer, segment the packet into cells, and schedule the cells for transmission. ATM interfaces use the SNMP object IDs in network functions such as permanent virtual circuit (PVC) autodiscovery, which is particularly useful in digital subscriber line (DSL) applications.

ILMI organizes managed objects into multiple information bases (MIBs), including one for link management. This MIB contains the following object groups for all ATM interfaces:

- Physical layer—ILMI 4.0 discontinues or "deprecates" earlier physical-layer ILMI values and specifies the use of the standard Interface MIB (RFC 1213).
- ATM layer—Indicates the number of available bits for VPI and VCI values in the ATM cell header, maximum number of virtual path connections (VPCs) and virtual channel connections (VCCs) allowed, number of configured PVCs, and so on.
- Virtual path connection—Indicates the up or down status of a VPC and its Quality of Service (QoS) parameters.
- Virtual channel connection—Indicates the up or down status of the VCC and its QoS parameters.

Administrators may enable or disable ILMI at will, but we highly recommend you enable it. Without ILMI, you must manually configure many of the parameters otherwise managed by ILMI for the ATM devices to operate correctly. ILMI operates over a reserved PVC of VPI=X, VCI=16.

## Understanding OAM

The Operation, Administration, and Maintenance (OAM) feature provides fault management and performance management for ATM and is based on the standard defined in ITU recommendation I.610. OAM detects network connectivity failures on a PVC and reacts by bringing down the PVC. Without OAM, a PVC would remain up after network connectivity is lost. In such a situation, routing table entries would continue to point to the PVC, resulting in lost packets.

Security Manager enables the use of F5 OAM, which operates at the virtual circuit (VC) level. To detect a failure along the PVC path on an end-device, such as a Cisco IOS router, OAM uses the following cells:

- Loopback cells—At regular intervals, routers configured for OAM send loopback cells which must be looped in the network. This looping point can be the machine at the end of the PVC (end-to-end loopback cells) or a device on the path (segment loopback cells). A failure occurs when the loopback cell fails to return to its point of origin.
- Continuity Check (CC) cells—CC cells are sent regularly by routers configured for OAM to check the integrity of the link. CC cells can be sent either end-to-end or confined to a particular segment of the PVC. Activation and deactivation cells are used to initiate and suspend continuity checking. Any connectivity failures are reported in special SNMP notifications.
- Alarm Indication Signal (AIS) cells—In the event of a failure at the physical layer, AIS cells are sent to downstream devices to report a virtual connection failure at the ATM layer. The PVC moves to the down state after a defined number of AIS cells are received and does not come up again until a defined interval passes without additional AIS cells.
- Remote Detection Indication (RDI) cells—When AIS cells are sent to warn downstream devices of a connectivity failure, RDI cells are sent upstream in response as a control and feedback mechanism for the network.

AIS/RDI cells are sent using the same VPI/VCI as the user cells on the affected PVC until the failure is resolved.

## Defining ATM PVCs

You define an ATM permanent virtual circuit (PVC) by selecting an ATM interface and then defining the following settings:

- The PVC ID.
- The type of encapsulation to use.
- Whether ILMI management is enabled on this PVC.
- Whether Inverse ARP (InARP) is used to learn the IP addresses of the destination devices.
- Options related to PPP over Ethernet (PPPoE) and PPP over ATM (PPPoA).
- Quality-of-service settings, such as traffic shaping.
- Static IP address mappings in place of InARP.

For information about defining F5 Operation, Administration, and Maintenance (OAM) management, such as loopbacks and continuity checks, on PVCs, see [Defining OAM Management on ATM PVCs, page 59-53](#).

### Before You Begin

- When configuring ATM over DSL, make sure that you have configured either an ADSL policy (see [ADSL on Cisco IOS Routers, page 59-33](#)) or an SHDSL policy ([SHDSL on Cisco IOS Routers, page 59-40](#)).
- Make sure that the device contains an ATM interface and subinterface. (PVCs are typically configured on ATM subinterfaces.) See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

#### Note

When configuring ATM for SHDSL, the ATM interface is created when you define the SHDSL controller and enable ATM mode. You must then rediscover the device to add the ATM interface to Security Manager. See [Defining SHDSL Controllers, page 59-40](#).

### Related Topics

- [Defining OAM Management on ATM PVCs, page 59-53](#)
- [Understanding Policing and Shaping Parameters, page 63-6](#)
- [PVCs on Cisco IOS Routers, page 59-46](#)

#### Step 1

Do one of the following:

- (Device view) Select **Interfaces > Settings > PVC** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PVC** from the Policy Type selector. Select an existing policy or create a new one.

The PVC page is displayed. See [Table 59-21 on page 59-55](#) for a description of the fields on this page.

#### Step 2

Click the **Add** button beneath the table to display the PVC dialog box. See [Table 59-22 on page 59-56](#) for a description of the fields in this dialog box.

#### Step 3

In the Interface field, enter the name of the ATM interface, ATM subinterface, or interface role on which you want to define the PVC, or click **Select** to select an interface role or to create a new one.

#### Step 4

Select the type of device or DSL WAN interface card that contains the ATM interface.

#### Note

We highly recommend that you define this setting to ensure the proper validation of your PVC policy, as the settings in this policy are highly hardware-dependent.

#### Step 5

On the Settings tab of the PVC dialog box, define the basic settings of the PVC:

- Enter the VPI/VCI identifier and an optional text handle. If you are defining the management PVC, select the **Management PVC (ILMI)** check box.

#### Note

An error occurs if two users attempt to define PVCs with the same identifiers at the same time.

- Select the type of ATM encapsulation to use. If you select `aal5autopp` or `aal5ciscopp`, you must define the virtual template to use for PPPoA, or click **Select** to display a selector. If you select `aal5mux` as the encapsulation type, you must select the protocol that is carried by the PVC.

---

**Note** Do not select an encapsulation type when defining the management PVC.

---

---

**Note** If you modify the virtual template settings on an existing PVC, you must enter the **shutdown** command followed by the **no shutdown** command on the ATM subinterface to restart the interface. This causes the newly configured parameters to take effect.

---

- c. Select the Enable ILMI check box to enable the ILMI to manage this PVC. For more information, see [Understanding ILMI, page 59-49](#).

---

**Note** You cannot configure the management PVC on a subinterface.

---

- d. Select the Inverse ARP check box to enable the PVC to dynamically learn the Layer 3 addresses that are required to forward traffic to those devices.

---

**Note** Alternatively, you can create static address mappings, as described in [Step 7](#).

---

- e. In the PPPoE Max Sessions field, define the maximum number of PPPoE sessions allowed on the PVC.
- f. In the VPN Service Name field, define the static domain name to use for PPPoA sessions on the PVC.

See [Table 59-23 on page 59-57](#) for a description of the fields on the Settings tab.

**Step 6** (Optional) On the QoS tab of the PVC dialog box, define the type of ATM traffic shaping to perform on the traffic carried by this PVC. Traffic shaping regulates the flow of traffic carried by the PVC by queuing traffic that exceeds the defined bit rates. See [Table 59-24 on page 59-61](#) for a description of the fields on the QoS tab.

**Step 7** (Optional) On the Protocol tab of the PVC dialog box, create static mappings for the IP addresses at the other end of the PVC:

- Click **Add** to display the Define Mapping dialog box. See [Table 59-26 on page 59-65](#) for a description of the fields in this dialog box.
- Select IP Address, then enter the address or network/host object that you want to map, or click **Select** to select a network/host object from a list or to create a new one.
- Click **OK**. The static mapping is displayed on the Protocol tab.
- Repeat [a.](#) through [c.](#) to define additional static mappings.

---

**Note** You can also use the Protocol tab to change the type of InARP to use, broadcast or non-broadcast.

---

**Step 8** Click **Advanced** to configure OAM management on the PVC. See [Defining OAM Management on ATM PVCs, page 59-53](#).

**Step 9** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the PVC table.

---

**Note** To edit a PVC, select it from the table, then click **Edit**. To remove a PVC, select it, then click **Delete**.

---

**Step 10** Repeat [Step 2](#) through [Step 9](#) to define additional PVCs.

---

## Defining OAM Management on ATM PVCs

Security Manager enables you to configure the following F5 (VC level) Operation, Administration, and Maintenance (OAM) cells for detecting PVC failures in a Cisco IOS router:

- Loopback cells
- Continuity Check (CC) cells
- Alarm Indication Signal (AIS) cells
- Remote Detection Indication (RDI) cells

You can enable and disable each of these cell types and define settings that determine how each cell type affects the PVC when a failure is detected.

### Before You Begin

- Select the ATM interface on which the PVC is defined.
- Define the general settings and the QoS settings of the PVC. See [Defining ATM PVCs, page 59-50](#).

### Related Topics

- [Defining ATM PVCs, page 59-50](#)
- [PVCs on Cisco IOS Routers, page 59-46](#)

---

**Step 1** In the PVC dialog box, click **Advanced** to display the PVC Advanced Settings dialog box. See [Table 59-27 on page 59-65](#) for a description of the fields in this dialog box.

**Step 2** Enable OAM loopback cells on the selected PVC:

- a. Click the **OAM-PVC** tab. See [Table 59-29 on page 59-68](#) for a description of the fields on this tab.
- b. Select the **Enable OAM Management** check box.
- c. Define the frequency of loopback cell transmissions.

**Step 3** (Optional) Enable segment CC cells on the PVC:

- a. Under Segment Continuity Check, select **Configure Continuity Check**.
- b. Choose whether the router should act as the sink, source, or both. This determines the direction in which CC cells are sent.
- c. Choose whether the PVC should remain up after segment or end-to-end failures are detected.

---

**Note** Select **Deny Activation Requests** to have the router reject CC activation requests received from peers.

---

- Step 4** (Optional) Enable end-to-end CC cells on the PVC, using the procedure described in [Step 3](#) for segment CC cells.
- Step 5** (Optional) Configure additional loopback cell parameters:
- Click the **OAM** tab.
  - Select the **Enable OAM Retry** check box, then define the down count, up count, and retry frequency. See [Table 59-28 on page 59-66](#) for a description of the available options.
- Step 6** (Optional) Configure additional CC cell parameters:
- Select the **Enable** check box for segment CC cells, then define the activation count, deactivation count, and retry frequency. These fields determine how many activation and deactivation requests are sent to peers and how often the router waits between each attempt. See [Table 59-28 on page 59-66](#) for a description of the available options.
  - Repeat [a.](#) for end-to-end CC cells.
- Step 7** (Optional) Configure AIS/RDI cells on the PVC:
- On the OAM tab, select the **Enable AIS-RDI Detection** check box.
  - Define how many AIS/RDI cells are required to move the PVC to the down state.
  - Define how many seconds must elapse without receiving AIS/RDI cells before moving the PVC to the up state.
- Step 8** Click **OK** to close the dialog box and return to PVC dialog box.
- 

## PVC Policy Page

Use the PVC page to create, edit, and delete permanent virtual connections (PVCs) on the router. PVCs allow direct and permanent connections between sites to provide a service that is similar to a leased line. These PVCs can be used in ADSL, SHDSL, or pure ATM environments. For more information, see [Defining ATM PVCs, page 59-50](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > PVC** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PVC** from the Policy Type selector. Right-click **PVC** to create a policy, or select an existing policy from the Shared Policy selector.

| ATM Interface  | The ATM interface on which the PVC is defined.                                                                                      |
| Interface Card | The type of device or WAN interface card on which the ATM interface resides.                                                        |
| PVC ID         | The Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) of the PVC.                                                  |
| Settings       | Additional settings configured for the PVC, including encapsulation, the number of PPPoE sessions, and the VPN service name.        |
| QoS            | Quality-of-service settings defined for the PVC, such as traffic shaping.                                                           |
| Protocol       | The IP protocol mappings (static maps or Inverse ARP) configured for the PVC.                                                       |
| OAM            | The F5 Operation, Administration, and Maintenance (OAM) loopback, continuity check, and AIS/RDI definitions configured for the PVC. |
| OAM-PVC        | The OAM management cells that are configured for the PVC.                                                                           |
| Add button     | Opens the <a href="#">PVC Dialog Box, page 59-55</a> . From here you can define a PVC.                                              |
| Edit button    | Opens the <a href="#">PVC Dialog Box, page 59-55</a> . From here you can edit the selected PVC.                                     |
| Delete button  | Deletes the selected PVC from the table.                                                                                            |

## PVC Dialog Box

Use the PVC dialog box to configure ATM permanent virtual circuits (PVCs).

You can configure the following types of interface cards:

- Unknown—The interface card type is not defined.
- WIC-1ADSL—A 1-port ADSL WAN interface card that provides ADSL over POTS (ordinary telephone lines).
- WIC-1ADSL-I-DG—A 1-port ADSL WAN interface card that provides ADSL over ISDN with Dying Gasp support. (With Dying Gasp, the router warns the DSLAM of imminent line drops when the router is about to lose power.)
- WIC-1ADSL-DG—A 1-port ADSL WAN interface card that provides ADSL over POTS with Dying Gasp support.
- HWIC-1ADSL—A 1-port high-speed ADSL WAN interface card that provides ADSL over POTS.
- HWIC-1ADSLI—A 1-port high-speed ADSL WAN interface card that provides ADSL over ISDN.
- HWIC-ADSL-B/ST—A 2-port high-speed ADSL WAN interface card that provides ADSL over POTS with an ISDN BRI port for backup.
- HWIC-ADSLI-B/ST—A 2-port high-speed ADSL WAN interface card that provides ADSL over ISDN with an ISDN BRI port for backup.
- WIC-1-SHDSL-V2—A 1-port multiline G.SHDSL WAN interface card with support for 2-wire mode and enhanced 4-wire mode.

- WIC-1-SHDSL-V3—A 1-port multiline G.SHDSL WAN interface card with support for 2-wire mode and 4-wire mode (standard & enhanced).
- NM-1A-T3—A 1-port ATM network module with a T3 link.
- NM-1A-OC3-POM—A 1-port ATM network module with an optical carrier level 3 (OC-3) link and three operating modes (multimode, single-mode intermediate reach (SMIR), and single-mode long-reach (SMLR)).
- NM-1A-E3—A 1-port ATM network module with an E3 link.
- 857 ADSL—Cisco 857 Integrated Service Router with an ADSL interface.
- 876 ADSL—Cisco 876 Integrated Services Router with an ADSL interface.
- 877 ADSL—Cisco 877 Integrated Services Router with an ADSL interface.
- 878 888 G.SHDSL—Cisco 878 Integrated Services Router with a G.SHDSL interface.
- 1801 ADSLoPOTS—Cisco 1801 Integrated Services Router that provides ADSL over POTS.
- 1802 ADSLoISDN—Cisco 1802 Integrated Services Router that provides ADSL over ISDN.
- 1803 G.SHDSL—Cisco 1803 Integrated Services Router that provides 4-wire G.SHDSL.

### Navigation Path

Go to the [PVC Policy Page, page 59-54](#), then click the **Add** or **Edit** button beneath the table.

## PVC Dialog Box—Settings Tab

Use the Settings tab of the PVC dialog box to configure the basic settings of the PVC, including:

- ID settings.
- Encapsulation settings.
- Whether ILMI and Inverse ARP are enabled.
- The maximum number of PPPoE sessions.
- The static domain (VPN service) name to use for PPPoA.

### Navigation Path

Go to the [PVC Dialog Box, page 59-55](#), then click the **Settings** tab.

**Table 59-23** PVC Dialog Box—Settings Tab

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PVC ID settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VPI             | <p>The virtual path identifier of the PVC. In conjunction with the VCI, identifies the next destination of a cell as it passes through a series of ATM switches on the way to its destination. Valid values for most platforms range from 0 to 255.</p> <p>For Cisco 2600 and 3600 Series routers using Inverse Multiplexing for ATM (IMA), valid values range from 0 to 15, 64 to 79, 128 to 143, and 192 to 207.</p> <p><b>Note</b> VPI/VCI values must be unique for all the PVCs configured on a selected interface. VPI/VCI values are unique to a single link only and might change as cells traverse the ATM network.</p> |

Table 59-23 PVC Dialog Box—Settings Tab (Continued)

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VCI                    | <p>The 16-bit virtual channel identifier of the PVC. In conjunction with the VPI, identifies the next destination of a cell as it passes through a series of ATM switches on the way to its destination. Valid values vary by platform. Typically, values up to 31 are reserved for special traffic (such as ILMI) and should not be used. 3 and 4 are invalid.</p> <p><b>Note</b> VPI/VCI values must be unique for all the PVCs configured on a selected interface. VPI/VCI values are unique to a single link only and might change as cells traverse the ATM network.</p>                                                         |
| Handle                 | <p>An optional name to identify the PVC. The maximum length is 15 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Management PVC (ILMI)  | <p>Does not apply when configuring the PVC on a subinterface.</p> <p>When selected, designates this PVC as the management PVC for this ATM interface by enabling communication with the Interim Local Management Interface (ILMI). ILMI is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. See <a href="#">Understanding ILMI, page 59-49</a>.</p> <p>When deselected, this PVC does not act as the management PVC. This is the default.</p> <p><b>Note</b> The VPI/VCI for the management PVC is typically set to 0/16.</p> |
| Encapsulation settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type             | <p>Does not apply when the Management PVC (ILMI) check box is enabled.</p> <p>The ATM adaptation layer (AAL) and encapsulation type to use on the PVC:</p> <ul style="list-style-type: none"> <li>• [blank]—The encapsulation type is not defined. (When deployed, aal5snap is applied.)</li> <li>• aal2—For PVCs dedicated to AAL2 Voice over ATM. AAL2 is used for variable bit rate (VBR) traffic, which can be either realtime (VBR-RT) or non-realtime (VBR-NRT).</li> <li>• aal5autopp—Enables the router to distinguish between incoming PPP over ATM (PPPoA) and PPP over Ethernet (PPPoE) sessions and create virtual access for both PPP types based on demand.</li> <li>• aal5ciscopp—For the proprietary Cisco version of PPP over ATM.</li> <li>• aal5mux—Enables you to dedicate the PVC to a single protocol, as defined in the Protocol field.</li> <li>• aal5nlpid—Enables ATM interfaces to work with High-Speed Serial Interfaces (HSSI) that are using an ATM data service unit (ADSU) and running ATM-Data Exchange Interface (DXI).</li> <li>• aal5snap—Supports Inverse ARP and incorporates the Logical Link Control/Subnetwork Access Protocol (LLC/SNAP) that precedes the protocol datagram. This allows multiple protocols to traverse the same PVC.</li> </ul> |
| Virtual Template | <p>The virtual template used for PPP over ATM on this PVC. Enter the name of a virtual template interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>When a user dials in, the virtual template is used to configure a virtual access interface. When the user is done, the virtual access interface goes down and the resources are freed for other dial-in users.</p> <p><b>Note</b> If you modify the virtual template settings on an existing PVC, you must enter the shutdown command followed by the no shutdown command on the ATM subinterface to restart the interface. This causes the newly configured parameters to take effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol            | <p>Applies only when aal5mux is the defined encapsulation type.</p> <p>The protocol carried by the MUX-encapsulated PVC:</p> <ul style="list-style-type: none"> <li>• frame-relay—Frame-Relay-ATM Network Interworking (FRF.5) on the Cisco MC3810.</li> <li>• fr-atm-srv—Frame-Relay-ATM Service Interworking (FRF.8) on the Cisco MC3810.</li> <li>• ip—IP protocol.</li> <li>• ppp—IETF-compliant PPP over ATM. You must specify a virtual template when using this protocol type.</li> <li>• voice—Voice over ATM.</li> </ul>                                         |
| Additional settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable ILMI         | <p>When selected, enables ILMI management on this PVC.</p> <p>When deselected, ILMI management on this PVC is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Inverse ARP         | <p>When selected, the Inverse Address Resolution Protocol (Inverse ARP) is enabled on the PVC.</p> <p>When deselected, Inverse ARP is disabled. This is the default.</p> <p>Inverse ARP is used to learn the Layer 3 addresses at the remote ends of established connections. These addresses must be learned before the virtual circuit can be used.</p> <p><b>Note</b> Use the Protocol tab to define static mappings of IP addresses instead of dynamically learning the addresses using Inverse ARP. See <a href="#">PVC Dialog Box—Protocol Tab, page 59-63</a>.</p> |
| PPPoE Max Sessions  | The maximum number of PPP over Ethernet sessions that are permitted on the PVC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VPN Service Name    | <p>The static domain name to use on this PVC. The maximum length is 128 characters.</p> <p>Use this option when you want PPP over ATM (PPPoA) sessions in the PVC to be forwarded according to the domain name supplied, without starting PPP.</p>                                                                                                                                                                                                                                                                                                                        |

## PVC Dialog Box—QoS Tab

Use the QoS tab of the PVC dialog box to configure the ATM traffic shaping and other quality-of-service settings of the PVC, including:

- The limit on packets placed on transmission rings.
- The QoS service.
- Whether random detection is enabled.

These settings regulate the flow of traffic over the PVC by queuing traffic that exceeds the defined allowable bit rates.

**Note**

QoS values are highly hardware dependent. Please refer to your router documentation for additional details about the settings that can be configured on your device.

**Navigation Path**

Go to the [PVC Dialog Box](#), page 59-55, then click the **QoS** tab.

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tx Ring Limit            | <p>The maximum number of transmission packets that can be placed on a transmission ring on the WAN interface card (WIC) or interface.</p> <p>The range of valid values depends on the type of interface card selected in the Settings tab. See <a href="#">PVC Dialog Box—Settings Tab</a>, page 59-57.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Traffic Shaping settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Traffic Shaping          | <p>The type of service to define on the PVC:</p> <ul style="list-style-type: none"> <li>• [null]—The bit rate is not defined.</li> <li>• ABR—Available Bit Rate. A best-effort service suitable for applications that do not require guarantees against cell loss or delays.</li> <li>• CBR—Constant Bit Rate service. Delay-sensitive data, such as voice or video, is sent at a fixed rate, providing a service similar to a leased line.</li> <li>• UBR—Unspecified Bit Rate service. A best-effort service suitable for applications that are tolerant to delay and do not require realtime responses.</li> <li>• UBR+—Unspecified Bit Rate service. Unlike UBR, UBR+ attempts to maintain a guaranteed minimum rate.</li> <li>• VBR-NRT—Variable Bit Rate - Non-Real Time service. A service suitable for non-realtime applications that are bursty in nature. VBR is more efficient than CBR and more reliable than UBR.</li> <li>• VBR-RT—Variable Bit Rate - Real Time service. A service suitable for realtime applications that are bursty in nature.</li> </ul> <p>For more information about each service class, see <a href="#">Understanding ATM Service Classes</a>, page 59-47.</p> |

Table 59-24 PVC Dialog Box—QoS Tab (Continued)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ABR     | <p>The following fields are displayed when ABR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate in kilobits per second (kbps). It specifies the maximum value of the ABR.</li> <li>• MCR—The minimum cell rate in kilobits per second (kbps). It specifies the minimum value of the ABR.</li> </ul> <p>The ABR varies between the MCR and the PCR. It is dynamically controlled using congestion control mechanisms.</p>                                                                                                                                                                                              |
| CBR     | <p>The following field is displayed when CBR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• Rate—The constant bit rate (also known as the average cell rate) for the PVC in kilobits per second (kbps). An ATM VC configured for CBR can send cells at this rate for as long as required.</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| UBR     | <p>The following field is displayed when UBR is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| UBR+    | <p>The following fields are displayed when UBR+ is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> <li>• MCR—The minimum guaranteed cell rate for output in kilobits per second (kbps). Traffic is always allowed to be sent at this rate.</li> </ul> <p><b>Note</b> UBR+ requires Cisco IOS Software Release 12.4(2)XA or later, or version 12.4(6)T or later.</p>                                                                                                                                                         |
| VBR-NRT | <p>The following fields are displayed when VBR-NRT is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• PCR—The peak cell rate for output in kilobits per second (kbps). Cells in excess of the PCR may be discarded.</li> <li>• SCR—The sustained cell rate for output in kilobits per second (kbps). This value, which must be lower than or equal to the PCR, represents the maximum rate at which cells can be transmitted without incurring data loss.</li> <li>• MBS—The maximum burst cell size for output. This value represents the number of cells that can be transmitted above the SCR but below the PCR without penalty.</li> </ul> |

**Table 59-24 PVC Dialog Box—QoS Tab (Continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VBR-RT          | <p>The following fields are displayed when VBR-RT is selected as the Bit Rate:</p> <ul style="list-style-type: none"> <li>• <b>Peak Rate</b>—The peak information rate for realtime traffic in kilobits per second (kbps).</li> <li>• <b>Average Rate</b>—The average information rate for realtime traffic in kilobits per second (kbps). This value must be lower than or equal to the peak rate.</li> <li>• <b>Burst</b>—The burst size for realtime traffic, in number of cells. Configure this value if the PVC carries bursty traffic.</li> </ul> <p>These values configure traffic shaping between realtime traffic (such as voice and video) and data traffic to ensure that the carrier does not discard realtime traffic, for example, voice calls.</p> |
| IP QoS settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Random Detect   | <p>When selected, enables Weighted Random Early Detection (WRED) or VIP-distributed WRED (DWRED) on the PVC.</p> <p>When deselected, WRED and DWRED are disabled. This is the default.</p> <p>WRED is a queue management method that selectively drops packets as the interface becomes congested. See <a href="#">Tail Drop vs. WRED</a>, page 63-4.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |

## PVC Dialog Box—Protocol Tab

Use the Protocol tab of the PVC dialog box to add, edit, or delete the protocol mappings configured for the PVC. You may configured static mappings or Inverse ARP (broadcast or nonbroadcast) for each PVC, but not both.

### Note

IP is the only protocol supported by Security Manager for protocol mapping on ATM networks. You cannot define protocol mappings on the Management PVC (ILMI).

### Navigation Path

Go to the [PVC Dialog Box](#), page 59-55, then click the **Protocol** tab.

**Field Reference****Table 59-25 PVC Dialog Box—Protocol Tab**

| Element             | Description                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| IP Protocol Mapping | Displays the IP protocol mappings configured for the PVC.                                                          |
| Add button          | Opens the <a href="#">Define Mapping Dialog Box, page 59-64</a> . From here you can define an IP protocol mapping. |
| Edit button         | Opens the <a href="#">Define Mapping Dialog Box, page 59-64</a> . From here you can edit the selected mapping.     |
| Delete button       | Deletes the selected mapping from the table.                                                                       |

**Define Mapping Dialog Box**

Use the Define Mapping dialog box to configure the IP protocol mappings to use on the ATM PVC. Mappings are required by the PVC to discover which IP address is reachable at the other end of a connection. Mappings can either be learned dynamically using Inverse ARP (InARP) or defined statically. Static mappings are best suited for simple networks that contain only a few nodes.

**Note**

Inverse ARP is only supported for the aal5snap encapsulation type. See [PVC Dialog Box—Settings Tab, page 59-57](#).

**Tip**

Use the CLI or FlexConfigs to configure mappings for protocols other than IP.

**Navigation Path**

Go to the [PVC Dialog Box—Protocol Tab, page 59-63](#), then click **Add** or **Edit**.

|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Options        | <p>The type of IP protocol mapping to use:</p> <ul style="list-style-type: none"> <li>IP Address—Select this option when using static mapping. Enter the address or the name of a network/host object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>InARP—Inverse ARP. Select this option when using dynamic mapping. This allows the PVC to resolve its own network addresses without configuring a static map. Dynamic mappings age out and are refreshed periodically every 15 minutes by default.</li> </ul> <p><b>Note</b> InARP can be used only when aal5snap is the defined encapsulation type for the PVC. See <a href="#">PVC Dialog Box—Settings Tab, page 59-57</a>.</p> |
| Broadcast Options | <p>Indicates whether to use this map entry when sending IP broadcast packets (such as EIGRP updates):</p> <ul style="list-style-type: none"> <li>Broadcast—The map entry is used for broadcast packets.</li> <li>No Broadcast—The map entry is used only for unicast packets.</li> <li>None—Broadcast options are disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## PVC Advanced Settings Dialog Box

Use the PVC Advanced Settings dialog box to configure F5 Operation, Administration, and Maintenance (OAM) functionality on an ATM PVC. OAM is used to detect connectivity failures at the ATM layer.

For more information, see [Defining OAM Management on ATM PVCs, page 59-53](#).

### Navigation Path

Go to the [PVC Dialog Box, page 59-55](#), then click **Advanced**.

### Field Reference

Table 59-27 PVC Advanced Settings Dialog Box

| Element     | Description                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------|
| OAM tab     | Defines loopback, connectivity check, and AIS/RDI settings. See <a href="#">PVC Advanced Settings Dialog Box—OAM Tab, page 59-66</a> .   |
| OAM-PVC tab | Enables OAM loopbacks and connectivity checks on the PVC. See <a href="#">PVC Advanced Settings Dialog Box—OAM-PVC Tab, page 59-68</a> . |

## PVC Advanced Settings Dialog Box—OAM Tab

Use the OAM tab of the PVC Advanced Settings dialog box to define:

- The number of loopback cell responses that move the PVC to the down or up state.
- The number of alarm indication signal/remote defect indication (AIS/RDI) cells that move the PVC to the down or up state.
- The number and frequency of segment/end continuity check (CC) activation and deactivation requests that are sent on this PVC.

For more information, see [Defining OAM Management on ATM PVCs, page 59-53](#).

### Note

The settings defined in this tab are dependent on the settings defined in the OAM-PVC tab. See [PVC Advanced Settings Dialog Box—OAM-PVC Tab, page 59-68](#).

### Navigation Path

Go to the [PVC Advanced Settings Dialog Box, page 59-65](#), then click the **OAM** tab.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retry settings   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable OAM Retry | When selected, OAM management settings can be defined.<br>When deselected, OAM management settings cannot be defined.<br><b>Note</b> If Enable OAM Management is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.                                                                                                                                                                                                                         |
| Down Count       | The number of consecutive, unreceived, end-to-end loopback cell responses that cause the PVC to move to the down state. The default is 3.                                                                                                                                                                                                                                                                                                                                                         |
| Up Count         | The number of consecutive end-to-end loopback cell responses that must be received in order to move the PVC to the up state. The default is 5.                                                                                                                                                                                                                                                                                                                                                    |
| Retry Frequency  | The interval between loopback cell verification transmissions in seconds. The default is 1 second.<br><br>If a PVC is up and a loopback cell response is not received within the specified interval (as defined in the Frequency field of the PVC-OAM tab), loopback cells are transmitted at the frequency defined here to verify whether the PVC is down. If the number of consecutive cells that do not receive a response matches the defined down count, the PVC is moved to the down state. |
| AIS-RDI settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 59-28 PVC Advanced Settings Dialog Box—OAM Tab (Continued)**

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable AIS-RDI Detection             | <p>When selected, alarm indication signal (AIS) cells and remote defect indication (RDI) cells are used to report connectivity failures at the ATM layer of the PVC.</p> <p>When deselected, AIS/RDI cells are disabled.</p> <p>AIS cells notify downstream devices of the connectivity failure. The last ATM switch then generates RDI cells in the upstream direction towards the device that sent the original failure notification.</p> |
| Down Count                           | The number of consecutive AIS/RDI cells that cause the PVC to go down. Valid values range from 1 to 60. The default is 1.                                                                                                                                                                                                                                                                                                                   |
| Up Count                             | The number of seconds after which a PVC is brought up if no AIS/RDI cells are received. Valid values range from 3 to 60 seconds. The default is 3.                                                                                                                                                                                                                                                                                          |
| Segment Continuity Check settings    |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Segment Continuity Check      | <p>When selected, OAM F5 continuity check (CC) activation and deactivation requests are sent to a device at the other end of a segment.</p> <p>When deselected, segment CC activation and deactivation requests are disabled.</p> <p><b>Note</b> If Configure Continuity Check is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p>                                              |
| Activation Count                     | The maximum number of times that the activation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                               |
| Deactivation Count                   | The maximum number of times that the deactivation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                             |
| Retry Frequency                      | The interval between activation/deactivation retries, in seconds. The default is 30 seconds.                                                                                                                                                                                                                                                                                                                                                |
| End-to-End Continuity Check settings |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable End-to-End Continuity Check   | <p>When selected, OAM F5 continuity check (CC) activation and deactivation requests are sent to a device at the other end of the PVC.</p> <p>When deselected, segment CC activation and deactivation requests are disabled.</p> <p><b>Note</b> If Configure Continuity Check is deselected in the OAM-PVC tab, these settings are saved in the device configuration but are not applied.</p>                                                |
| Activation Count                     | The maximum number of times that the activation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                               |
| Deactivation Count                   | The maximum number of times that the deactivation request is sent before the receipt of an acknowledgement. Valid values range from 3 to 600. The default is 3.                                                                                                                                                                                                                                                                             |

| Retry Frequency | The interval between activation/deactivation retries, in seconds. The default is 30 seconds. |

## PVC Advanced Settings Dialog Box—OAM-PVC Tab

Use the OAM-PVC tab of the PVC Advanced Settings dialog box to enable loopback cells and connectivity checks (CCs) on the PVC. These functions test the connectivity of the virtual connection.

For more information, see [Defining OAM Management on ATM PVCs, page 59-53](#).

### Note

Use the OAM tab to define additional settings related to the settings on this tab. See [PVC Advanced Settings Dialog Box—OAM Tab, page 59-66](#).

### Navigation Path

Go to the [PVC Advanced Settings Dialog Box, page 59-65](#), then click the **OAM-PVC** tab.

## PPP on Cisco IOS Routers

The Point-to-Point Protocol (PPP), as defined in RFC 1661, provides a method for transporting packets between two devices or hosts using physical or logical links. PPP is a Layer 2 data-link protocol that can work with multiple Layer 3 network-layer protocols, including IP, IPX, and AppleTalk.

PPP is used in many common scenarios, such as:

- Connecting remote users to a central network over dial-in connections.
- Connecting the gateway of an enterprise network to an ISP for internet access.
- Connecting two LANs (for example, a central office and a branch office) to exchange data between them.

PPP connectivity is established in stages:

1. First, a Link Control Protocol (LCP) establishes, configures, and tests the data-link connection.
2. (Optional) Authentication verifies the identity of the two parties.
3. A family of Network Control Protocols (NCPs) establishes and configures the necessary network-layer protocols.

The PPP policy in Security Manager provides a method for configuring selected parameters that are negotiated between the two nodes during the LCP stage, including authentication (typically CHAP or PAP) and Multilink PPP (MLP). For more information about MLP, see [Defining Multilink PPP Bundles](#), page 59-74.

The following topics describe the tasks you perform to create PPP policies on Cisco IOS routers:

- [Defining PPP Connections](#), page 59-71
- [Defining Multilink PPP Bundles](#), page 59-74

## Understanding Multilink PPP (MLP)

MLP, as defined in RFC 1990, is a method for splitting, recombining, and sequencing datagrams across multiple logical data links. MLP was originally designed to exploit multiple bearer channels in ISDN, but it can be used whenever multiple PPP links connect two systems, including asynchronous links.

MLP spreads inbound and outbound traffic across multiple physical WAN links (known collectively as a bundle) while providing the following benefits:

- Packet fragmentation and reassembly
- Proper sequencing
- Multivendor interoperability
- Load balancing

As shown in [Figure 59-3](#), traffic routed across an MLP link is fragmented, with the fragments being sent across the different physical links. At the remote end of the link, the fragments are reassembled and forwarded to the next hop toward their ultimate destination. By using multiple physical links, MLP provides a way to temporarily use the additional bandwidth afforded by these links.

**Figure 59-3** Multilink PPP

Every MLP bundle is controlled by a single interface, the bundle master, which is a virtual-access interface. This interface is created in the background when the bundle is first created. The physical interface becomes part of the bundle that is managed by the bundle master. Bundles are also used when you create a multilink group consisting of a multilink interface and its associated serial interfaces, which is a setup that is often found in static, leased-line environments.

MLP uses an endpoint discriminator to identify the system transmitting a packet. By default, this discriminator is based on the hostname of the router, but it can also be based on other criteria, such as the IP address or MAC address of the interface, a telephone number, or a user-defined string. If the endpoint discriminator matches the discriminator of an existing link, the new link is added to the matching bundle. If no match exists, a new bundle is created. When authentication is used, a new bundle is established whenever there is a mismatch in either the discriminator or the authentication information exchanged between the two nodes.

## Defining PPP Connections

When you define a PPP connection, the first step is to select the interface on which PPP should be enabled. You must select one of the following interface types:

- Async
- Group-Async
- Serial
- High-Speed Serial Interface (HSSI)
- Dialer
- BRI, PRI (ISDN)
- Virtual template

- Multilink

You cannot define PPP connections on:

- Subinterfaces.
- Serial interfaces with Frame Relay encapsulation.
- Virtual template interfaces defined as Ethernet or tunnel types (serial is supported).

**Note**

You cannot configure PPP on serial interfaces that are configured for Frame Relay encapsulation. See [Defining Basic Router Interface Settings, page 59-3](#).

**Note**

Deployment might fail if you define PPP on a virtual template that is also used in an 802.1x policy. See [Defining 802.1x Policies, page 61-4](#).

You can select one or more authentication protocols and define when authentication should be performed.

In addition, you can configure the authentication and authorization methods to use when performing AAA on a remote security server. You can either define a default method list to use for all PPP connections on the device or define a customized method list that applies to a specific connection.

**Before You Begin**

- Make sure that the device contains an interface on which PPP can be configured. See [Basic Interface Settings on Cisco IOS Routers, page 59-1](#).

**Related Topics**

- [Defining Multilink PPP Bundles, page 59-74](#)
- [PPP on Cisco IOS Routers, page 59-70](#)

**Step 1**

Do one of the following:

- (Device view) Select **Interfaces > Settings > PPP/MLP** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PPP/MLP** from the Policy Type selector. Select an existing policy or create a new one.

The PPP/MLP page is displayed. See [Table 59-30 on page 59-75](#) for a description of the fields on this page.

**Step 2**

Click the **Add** button beneath the table to display the PPP dialog box.

**Step 3**

In the Interface field, enter the name of the interface or interface role on which you want to define the PPP connection, or click **Select** to select an interface role from a list or to create a new one.

**Step 4**

(Optional) On the PPP tab, define authentication for the PPP connection:

- Select one or more authentication protocols.
- Select one or more authentication options. These options determine when to perform authentication (callin, callout, and callback), whether to use one-time passwords, and whether to allow a mobile station in a PDSN configuration to receive Simple IP and Mobile IP services without using CHAP or PAP.

---

**Note** The Call Back option only enables authentication during callback. Use the CLI or FlexConfigs to configure the callback feature on the device.

---

- c. See [PPP Dialog Box—PPP Tab, page 59-77](#) for a description of the fields on this tab.

**Step 5** (Optional) When using a remote AAA server to perform authentication, select Default List or Custom Method List in the Authenticate Using field, then define the methods to use in the Prioritized Method List field.

---

**Note** If you modify the default list, your changes affect all PPP connections on the devices that use this list. If you leave this field blank, authentication is performed using the local database on the device.

---

**Step 6** (Optional) When using a remote AAA server to perform authorization, select AAA Policy Default List or Custom Method List, then define the methods to use in the Prioritized Method List field.

---

**Note** If you choose AAA Policy Default List, the device uses the default authorization methods defined in the AAA policy. See [Defining AAA Services, page 60-4](#).

---

**Step 7** (Optional) Define the username and password to send in response to PAP authentication requests.

---

**Note** If you entered the encrypted version of the password, select the **Encrypted** check box.

---

**Step 8** (Optional) Define a different hostname to send in all CHAP challenges and responses in place of the router's own hostname.

---

**Note** If you entered the encrypted version of the password, select the **Encrypted** check box.

---

**Step 9** (Optional) To enable Multilink PPP on this connection, click the **MLP** tab. See [Defining Multilink PPP Bundles, page 59-74](#).

**Step 10** Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the PPP table.

---

**Note** To edit a PPP connection, select it from the table, then click **Edit**. To remove a PPP connection, select it, then click **Delete**.

---

**Step 11** Repeat [Step 2](#) to [Step 10](#) to define PPP connections on additional interfaces. Only one PPP connection may be defined on an interface.

---

## Defining Multilink PPP Bundles

You enable Multilink PPP (MLP) on the selected interface by selecting the check box at the top of the Multilink tab in the PPP dialog box. You can optionally enable Multiclass Multilink PPP (MCMP), which prevents delay-sensitive traffic from fragmentation, and interleaving, which enables packets to be interspersed among the fragments of larger packets. If you want to restrict a serial interface to a specific bundle, you can select the multilink interface that represents that bundle.

In addition, you can optionally modify the following default settings:

- The maximum fragment delay.
- The endpoint discriminator that identifies the router when negotiating the use of MLP.
- The maximum receive reconstructed unit (MRRU) permitted by the router and its peers.
- The maximum queue depth for first-in, first-out (FIFO) and non-FIFO queues.

### Before You Begin

- Select the interface on which the PPP connection should be enabled.

### Related Topics

- [PPP on Cisco IOS Routers, page 59-70](#)

- 
- Step 1** In the PPP dialog box, click the **MLP** tab. See [PPP Dialog Box—MLP Tab, page 59-79](#) for a description of the fields on this tab.
- Step 2** Select the **Enable Multilink Protocol (MLP)** check box.
- Step 3** (Optional) Configure one or more of the following options:
- a. Whether to enable the multiclass feature that prevents delay-sensitive traffic from being fragmented. This is achieved by placing delay-sensitive traffic in a separate class from regular traffic.
  - b. Whether to enable the interleaving of packets among the fragments of larger packets on the MLP bundle.
  - c. Whether to restrict the physical link to joining only a designated multilink-group (defined by selecting a multilink interface). If a peer at the other end of the link tries to join a different bundle, the connected is severed.
  - d. Whether to modify the default amount of time required to transmit a fragment on the MLP bundle. The default is 30 milliseconds.

**Note** If you enable interleaving without defining a fragment delay, the default delay of 30 seconds is configured. This value does not appear in Security Manager or in the device configuration.

- Step 4** (Optional) Under Endpoint, modify the default endpoint discriminator used on the MLP bundle. The endpoint discriminator is used to identify the router on the MLP bundle. The default endpoint discriminator is either the globally configured hostname, or the PAP username or CHAP hostname (depending on the authentication protocol being used), if you configured those values on the PPP tab. See [Defining PPP Connections, page 59-71](#).
- Step 5** (Optional) In the MRRU fields, modify the default maximum packet size that the router (local) or the peer (remote) is capable of receiving.

- Step 6** (Optional) Modify the default maximum size of link transmit queues when using FIFO and non-FIFO (QoS) queuing.
- Step 7** Click **OK** to close the dialog box. Your definitions are displayed on the PPP page.

## PPP/MLP Policy Page

Use the PPP/MLP page to create, edit, and delete PPP connections on the router. For more information, see [Defining PPP Connections, page 59-71](#).

### Navigation Path

- (Device view) Select **Interfaces > Settings > PPP/MLP** from the Policy selector.
- (Policy view) Select **Router Interfaces > Settings > PPP/MLP** from the Policy Type selector. Right-click **PPP/MLP** to create a policy, or select an existing policy from the Shared Policies selector.

| Element        | Description                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface      | The interface that is configured for PPP/MLP.                                                                                                     |
| Authentication | The types of authentication used on the PPP connection.                                                                                           |
| Authorization  | The method list used for AAA authorization on the PPP connection.                                                                                 |
| Multilink      | Indicates whether Multilink PPP (MLP) is enabled on this PPP connection.                                                                          |
| Endpoint       | The type of default endpoint discriminator to use when negotiating the use of MLP with the peer.                                                  |
| Multiclass     | Indicates whether the Multiclass Multilink PPP (MCMP) feature is enabled on this PPP connection.                                                  |
| Group          | The number of the multilink-group interface to which the physical link is restricted.                                                             |
| Interleave     | Indicates whether the PPP multilink interleave feature is enabled on this PPP connection.                                                         |
| Add button     | Opens the <a href="#">PPP Dialog Box, page 59-76</a> . From here you can define the authentication and multilink settings for the PPP connection. |
| Edit button    | Opens the <a href="#">PPP Dialog Box, page 59-76</a> . From here you can edit the selected PPP connection.                                        |
| Delete button  | Deletes the selected PPP connection from the table.                                                                                               |

## PPP Dialog Box

Use the PPP dialog box to configure PPP connections on the router. When you configure a PPP connection, you can define the type of authentication and authorization to perform and define multilink parameters.

### Navigation Path

Go to the [PPP/MLP Policy Page, page 59-75](#), then click the **Add** or **Edit** button beneath the table.

| Hostname                     | By default, the router uses its hostname to identify itself to the peer. If required, you can enter a different hostname to use for all CHAP challenges and responses. For example, use this field to specify a common alias for all routers in a rotary group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Secret                       | The secret used to compute the response value for any CHAP challenge from an unknown peer. Enter the secret again in the Confirm field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Encrypted Secret             | When selected, this indicates that the password you entered is already encrypted. When deselected, this indicates that the password you entered is in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Authorization settings       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authorize Using              | <p>AAA authorization settings for the PPP connection:</p> <ul style="list-style-type: none"> <li>• <b>AAA Policy Default List</b>—Uses the default authorization method list that is defined in the device's AAA policy. See <a href="#">AAA Policy Page, page 60-6</a>.</li> <li>• <b>Prioritized Method List</b>—Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select it. Use the up and down arrows to define the order in which selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> </ul> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> Leave this field blank to perform authorization using the local database on the router.</p> |

## PPP Dialog Box—MLP Tab

Use the MLP tab of the PPP dialog box to define Multilink PPP (MLP) parameters for the selected PPP connection.

### Navigation Path

Go to the [PPP Dialog Box, page 59-76](#), then click the **MLP** tab.

| Element                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Multilink PPP (MLP)                                       | <p>When selected, MLP is enabled on this PPP connection.</p> <p>When deselected, MLP is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow Multiple Data Classes                                      | <p>When selected, enables multiple data classes on the MLP bundle. Delay-sensitive traffic is placed into Class 1, where it can be interleaved but never fragmented. Normal data traffic is placed into Class 0, which is subject to fragmentation just as regular multilink packets are.</p> <p>When deselected, all traffic is subject to fragmentation.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| Enable Interleaving of Packets Among Fragments of Larger Packets | <p>When selected, enables the interleaving of packets among the fragments of larger packets on the MLP bundle.</p> <p><b>Note</b> If you enable interleaving without defining a fragment delay, the default delay of 30 seconds is configured. This value does not appear in Security Manager or in the device configuration.</p> <p>When deselected, interleaving is disabled.</p> <p><b>Note</b> Serial interfaces do not support interleaving.</p>                                                                                                                                                                                                                                                                                             |
| Multilink Group                                                  | <p>Applies only to serial, Group-Async, and multilink interfaces.</p> <p>Restricts the physical link to the selected multilink-group interface. Enter the name of a multilink interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>This option is typically used in static leased-line environments, where the remote systems to which the device's serial lines are connected are known in advance.</p> <p>In effect, this option dedicates a specific interfaces to a particular user, even when that user is not connected. If a peer at the other end of the link tries to join a different bundle, the connected is severed.</p> |
| Maximum Fragment Delay                                           | <p>The maximum amount of time that should be required to transmit a fragment on the MLP bundle. Valid values range from 1 to 1000 milliseconds.</p> <p>Fragment size is determined by the defined fragment delay and the bandwidth of the links.</p> <p><b>Note</b> Serial interfaces do not support this feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Endpoint Type           | <p>The identifier used by the router when transmitting packets on the MLP bundle:</p> <ul style="list-style-type: none"> <li>• [null]—Negotiation is conducted without using an endpoint discriminator. (No CLI command is generated.)</li> <li>• Hostname—The hostname of the router. This option is useful when multiple routers are using the same username to authenticate but have different hostnames.</li> <li>• IP—A defined IP address. Enter the address or the name of a network/host object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• MAC—The MAC address of a specific interface. Enter the name of the interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</li> <li>• None—Negotiation is conducted without using an endpoint discriminator. (The relevant CLI command is generated, but no endpoint discriminator is provided.) This option is useful when the router is connected to a malfunctioning peer that does not handle the endpoint discriminator properly.</li> <li>• Phone—An E.164-compliant telephone number. Enter the number in the field displayed.</li> <li>• String—A character string. Enter the string in the field displayed.</li> </ul> <p>The default endpoint discriminator is either the globally configured hostname, or the PAP username or CHAP hostname (depending on the authentication protocol being used), if you have configured those values on the PPP tab.</p> |
| MRRU Local Peer         | <p>The maximum receive reconstructed unit (MRRU) value of the local peer. This value represents the maximum size packet that the local router is capable of receiving.</p> <p>Valid values range from 128 to 16384 bytes. The default is the maximum transmission unit (MTU) of the multilink group interface and 1524 bytes for all other interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MRRU Remote Peer        | <p>The maximum receive reconstructed unit (MRRU) value of the remote peer. This value represents the maximum size packet that the remote peer is capable of receiving.</p> <p>Valid values range from 128 to 16384 bytes. The default is 1524 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Maximum FIFO Queue Size | <p>The maximum queue depth when the bundle uses first-in, first-out (FIFO) queuing. Valid values range from 2 to 255 packets. The default is 8.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Maximum QoS Queue Size  | <p>The maximum queue depth when the bundle uses non-FIFO queuing. Valid values range from 2 to 255 packets. The default is 2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# CHAPTER 60

## Router Device Administration

## AAA on Cisco IOS Routers

Authentication, authorization, and accounting (AAA) network security services provide the primary framework through which you set up access control on your Cisco IOS router. Use the AAA policy in Security Manager to enable AAA functionality on Cisco IOS routers and to configure default AAA settings. The default settings that you define in this policy can be used in other policies, such as HTTP and line access (console and VTY) policies. Enabling AAA functionality is a prerequisite for any device policy that makes use of AAA, including NAC, SDP, and 802.1x.

For more information about AAA, see:

- [Supported Authorization Types, page 60-2](#)
- [Supported Accounting Types, page 60-3](#)
- [Understanding Method Lists, page 60-3](#)

To configure a AAA policy, see:

- [Defining AAA Services, page 60-4](#)

### Related Topics

- [Understanding AAA Server and Server Group Objects, page 6-24](#)
- [Line Access on Cisco IOS Routers, page 60-35](#)

## Supported Authorization Types

AAA authorization enables you to limit the services available to an authenticated user. Security Manager supports the following types of authorization:

- Network—Authorizes various types of network connections, such as PPP, SLIP, and ARAP.
- EXEC—Authorizes the launching of EXEC (CLI) sessions.
- Command—Authorizes the use of all EXEC mode commands that are associated with specific privilege levels.

When authorization is enabled, the router uses information retrieved from the user's profile to configure the user session. The profiles are located either in the local user database or on a security server. Users are granted access to a requested service only if the profile allows it.

- [AAA on Cisco IOS Routers, page 60-2](#)

## Supported Accounting Types

AAA accounting enables you to track the services the users are accessing and the amount of network resources that they are consuming. Security Manager supports the following accounting types:

- **Connection**—Records information about all outbound connections made from this device, such as Telnet, local-area transport (LAT), TN3270, packet assembler/disassembler (PAD), and rlogin connections.

For example, a RADIUS connection accounting record for an outbound Telnet connection includes such information as the port and IP address of the network access server (NAS), the start and end times of the connection, the identity of the user, and the number of packets that were transmitted during the session.

- **EXEC**—Records information about user EXEC (CLI) sessions on the devices, including the username, date, start and stop times, and the IP address of the NAS. For dial-in users, the record includes the telephone number from which the call originated.
- **Command**—Records information about the EXEC commands executed on the device by users with specific privilege levels. Each command accounting record includes a list of the commands executed for that privilege level, the date and time each command was executed, and the name of the user who executed it.

For each accounting type, you can choose whether you want to generate an accounting record at the start and end of each user session or only at the end.

When AAA accounting is enabled, the router sends accounting records of user activity to the TACACS+ or RADIUS security server. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can later be analyzed for network management, client billing, and auditing purposes.

- [Defining AAA Services, page 60-4](#)
- [AAA on Cisco IOS Routers, page 60-2](#)

## Understanding Method Lists

A method list is a sequential list describing the methods to use to perform a particular AAA function. In Security Manager, you define method lists by selecting AAA server groups, which are reusable objects that typically contain one or more AAA servers running the same protocol, such as RADIUS or TACACS+. Method lists enable you to designate one or more security protocols to be used for each AAA function, thus ensuring a backup system if the initial method fails.

### Note

Security Manager also contains predefined AAA server group objects for using the enable password or a local database. See [Predefined AAA Authentication Server Groups, page 6-28](#).

For each AAA function, the device initially uses the first method defined in the list. If that method fails to respond, the device selects the next method in the list. This process continues until there is successful communication with a listed method, or all methods defined in the method list are exhausted.

**Note**

The device attempts to communicate with the next listed method only when there is no response from the previous method. If the AAA service fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access or services—the process stops and no other methods are attempted.

- [AAA on Cisco IOS Routers, page 60-2](#)

## Defining AAA Services

To define AAA services on a Cisco IOS router, you must first enable AAA functionality on the router. After you do this, you can define the kind of functionality (authentication, authorization, and accounting) that you want the device to implement. You must define a method list for each function, including lists for each type of authorization and accounting that you enable.

For example, if you want to configure EXEC authorization and command authorization, you must define one method list for EXEC authorization and other method lists for each privilege level on which command authorization is performed.

**Note**

If you use RADIUS for authentication, you must use the same RADIUS server group for authorization as well.

**Related Topics**

- [Understanding Method Lists, page 60-3](#)
- [AAA on Cisco IOS Routers, page 60-2](#)
- [Understanding AAA Server and Server Group Objects, page 6-24](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > AAA** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > AAA** from the Policy Type selector. Select an existing policy or create a new one.

The AAA page is displayed. See [AAA Policy Page, page 60-6](#) for a description of the fields on this page.

**Step 2** Define which login authentication methods to use on users who access the device:

- On the Authentication tab (see [AAA Page—Authentication Tab, page 60-6](#)), select the **Enable Device Login Authentication** check box.
- Enter the names of one or more AAA server group objects (up to four) in the Prioritized Method List field, or click **Select** select the object from a list or to create a new one. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used.

---

**Note** If you select None as a method, it must appear as the last method in the list.

---

- Step 3** (Optional) In the Maximum Number of Attempts field, define the maximum number of unsuccessful authentication attempts to allow before a user is locked out.
- Step 4** (Optional) Define which authorization methods to use on users who have been successfully authenticated:
- Click the **Authorization** tab on the AAA page. See [Table 60-3 on page 60-8](#) for a description of the fields on this tab.
  - Define method lists for one or more of the following types of authorization:

- Network
- EXEC
- Command—Click the **Add** button to display the Command Authorization dialog box (see [Command Authorization Dialog Box, page 60-9](#)). From here, you can select a privilege level and the method list to apply to it.

For more information about these authorization types, see [Supported Authorization Types, page 60-2](#).

---

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

---

- Step 5** (Optional) Define which accounting methods to use on the activities performed by users:
- Click the **Accounting** tab on the AAA page. See [Table 60-5 on page 60-11](#) for a description of the fields on this tab.
  - Define method lists for one or more of the following types of accounting:

- Connection
  - EXEC
  - Command—Click the **Add** button to display the Command Accounting dialog box (see [Command Accounting Dialog Box, page 60-12](#)). From here, you can select a privilege level and the method list to apply to it.
- For more information about these accounting types, see [Supported Accounting Types, page 60-3](#).
- For each accounting type defined above, select a value from the Accounting Process Notices list. This defines when to create an accounting record, at the beginning and end of the user process or only at the end.
  - For each accounting type defined above, select the **Enable broadcast to multiple servers** check box if you want accounting information sent simultaneously to the first server in each AAA server group defined in the method list.

# AAA Policy Page

Use the AAA page to define the default authentication, authorization, and accounting methods to use on the router. You do this by configuring method lists, which define which methods to use and the sequence in which to use them.

**Note**

You can use the method lists defined in this policy as default settings when you configure AAA on the router's console port and VTY lines. See [Console Policy Page, page 60-42](#) and [VTY Policy Page, page 60-50](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > AAA** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > AAA** from the Policy Type selector. Right-click **AAA** to create a policy, or select an existing policy from the Shared Policy selector.

## AAA Page—Authentication Tab

Use the Authentication tab of the AAA page to define the methods used to authenticate users who access the device. Authentication methods are defined in a method list, which define the security protocols to use, such as LDAP, RADIUS, and TACACS+.

**Note**

You can use the method list defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page, page 60-42](#) and [VTY Line Dialog Box—Authentication Tab, page 60-55](#).

**Navigation Path**

Go to the [AAA Policy Page, page 60-6](#), then click the **Authentication** tab.

| Enable Device Login Authentication | When selected, enables the authentication of all users when they log in to the device, using the methods defined in the method list.<br><br>When deselected, authentication is not performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Prioritized Method List            | Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.<br><br>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.<br><br>Supported methods include Line, Local, Kerberos, LDAP, RADIUS, TACACS+, and None.<br><br><b>Note</b> If you select None as a method, it must appear as the last method in the list. |
| Maximum Number of Attempts         | The maximum number of unsuccessful authentication attempts before a user is locked out. This feature is disabled by default. Valid values range from 1 to 65535.<br><br><b>Note</b> From the standpoint of the user, there is no distinction between a normal authentication failure and an authentication failure due to being locked out. The system administrator has to explicitly clear the status of a locked-out user using <b>clear</b> commands.                                                                                                                                                                                                                                                                                                                                                        |

## AAA Page—Authorization Tab

Use the Authorization tab of the AAA page to define the type of authorization services to enable on the device and the methods to use for each type. Security Manager supports the following types of authorization:

- Network—Authorizes various types of network connections, such as PPP.
- EXEC—Authorizes the launching of EXEC sessions.

- Command—Authorizes the use of all EXEC mode commands that are associated with specific privilege levels.

**Note** You can use the method lists defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page, page 60-42](#) and [VTY Line Dialog Box—Authentication Tab, page 60-55](#).

### Navigation Path

Go to the [AAA Policy Page, page 60-6](#), then click the **Authorization** tab.

If that method fails to respond, the device tries the next method, and so on, until a response is received. |
| Command Authorization settings           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Privilege Level                          | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Prioritized Method List                  | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Add button                               | Opens the <a href="#">Command Authorization Dialog Box, page 60-9</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Edit button                              | Opens the <a href="#">Command Authorization Dialog Box, page 60-9</a> . From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Delete button                            | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Command Authorization Dialog Box

Use the Command Authorization dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege level. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [AAA Page—Authorization Tab, page 60-7](#), click the **Add** button beneath the Command Authorization table.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level         | The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Prioritized Method List | <p>Defines a sequential list of methods to be used when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include TACACS+, Local, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## AAA Page—Accounting Tab

Use the Accounting tab of the AAA page to define the type of accounting services to enable on the device and the methods to use for each type. Security Manager supports the following types of accounting:

- Connection—Records information about all outbound connections made from this device.
- EXEC—Records information about user EXEC sessions on the devices, including the username, date, start and stop times, and the IP address.
- Command—Records information about the EXEC commands executed on the device by users with specific privilege levels.

In addition, you use the Accounting page to determine when accounting records should be generated and whether they should be broadcast to more than one AAA server.

**Note**

You can use the method lists defined in this policy on the console and VTY lines that are used to communicate with the device. See [Console Policy Page, page 60-42](#) and [VTY Line Dialog Box—Authentication Tab, page 60-55](#).

**Navigation Path**

Go to the [AAA Policy Page, page 60-6](#), then click the **Accounting** tab.

| Enable Connection Accounting          | <p>When selected, enables the recording of information about outbound connections (such as Telnet) made over this device, using the methods defined in the method list.</p> <p>When deselected, connection accounting is not performed.</p>                                                                                                                                                                                                                                                                                                         |
| Generate Accounting Records for       | <p>Defines when the device sends an accounting notice to the accounting server:</p> <ul style="list-style-type: none"> <li>• <b>Start and Stop</b>—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record.</li> <li>• <b>Stop Only</b>—Generates an accounting record at the end of the user process only.</li> <li>• <b>None</b>—Disables this type of accounting.</li> </ul>                                   |
| Prioritized Method List               | <p>Defines a sequential list of methods to be queried when creating connection accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>Supported methods include LDAP, RADIUS, and TACACS+.</p> |
| Enable Broadcast to Multiple Servers  | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                         |
| <b>EXEC Accounting Settings</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable CLI/EXEC Operations Accounting | <p>When selected, enables the recording of basic information about user EXEC sessions, using the methods defined in the method list.</p> <p>When deselected, EXEC accounting is not performed.</p>                                                                                                                                                                                                                                                                                                                                                  |
| Generate Accounting Records for       | See description <a href="#">Table 42-7 on page 42-17</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prioritized Method List               | <p>Defines a sequential list of methods to be queried when creating connection accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                             |

**Table 60-5** AAA Page—Accounting Tab (Continued)

| Element                              | Description                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Broadcast to Multiple Servers | When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group. |
| <b>Command Accounting settings</b>   |                                                                                                                                                                                                                                                                                                               |
| Privilege Level                      | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                    |
| Generate Accounting Records for      | The points in the process where the device sends an accounting notice to the accounting server.                                                                                                                                                                                                               |
| Enable Broadcast                     | Whether accounting records are broadcast to multiple servers simultaneously.                                                                                                                                                                                                                                  |
| Prioritized Method List              | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                      |
| Add button                           | Opens the <a href="#">Command Accounting Dialog Box, page 60-12</a> . From here you can configure a command accounting definition.                                                                                                                                                                            |
| Edit button                          | Opens the <a href="#">Command Accounting Dialog Box, page 60-12</a> . From here you can edit the command accounting definition.                                                                                                                                                                               |
| Delete button                        | Deletes the selected command accounting definitions from the table.                                                                                                                                                                                                                                           |

## Command Accounting Dialog Box

Use the Command Accounting dialog box to define which methods to use when recording information about the EXEC commands that are executed for a given privilege level. Each accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the name of the user who executed it.

### Navigation Path

From the [AAA Page—Accounting Tab, page 60-10](#), click the **Add** button beneath the Command Accounting table.

| Generate Accounting Records for      | <p>Defines when the device sends an accounting notice to the accounting server:</p> <ul style="list-style-type: none"> <li>• <b>Start and Stop</b>—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record.</li> <li>• <b>Stop Only</b>—Generates an accounting record at the end of the user process only.</li> <li>• <b>None</b>—No accounting records are generated.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                    |
| Prioritized Method List              | <p>Defines a sequential list of methods to be used when creating accounting records for a user. Enter the names of one or more AAA server group objects (up to 10 for IOS 12.4(22)T+, otherwise up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>TACACS+ is the only supported method, but you can select multiple AAA server groups configured with TACACS+.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Enable Broadcast to Multiple Servers | <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## User Accounts and Device Credentials on Cisco IOS Routers

Accounts and credential policies define the contact information for accessing the router, including the privilege level provided to each user account. You can configure as many user accounts as required. However, the user account that Security Manager uses to connect to the router is always the one configured in the Device Properties page.

Additionally, you use device access policies to define the enable or enable secret password required to access privileged EXEC mode. This is the mode required to make any configuration changes on the router.

**Note**

If you use this policy to define a password, be careful later not to unassign this policy without assigning a replacement policy before your next deployment. If you deploy a device access policy that removes this password and the device contains a different type of password not known to Security Manager, such as a line console password, you will not be able to configure this device in the future. This is because the device reverts to this unknown password if Security Manager removes the enable password that it had previously configured.

**Related Topics**

- [Defining Accounts and Credential Policies, page 60-14](#)

## Defining Accounts and Credential Policies

This procedure describes how to define a device access policy on a Cisco IOS router. If the username that you configured on the Device Properties page to connect to the router (see [Viewing or Changing Device Properties, page 3-39](#)) matches one of the user accounts you defined in this policy, Security Manager updates the device credentials according to your policy definition.

If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, or change the enable password, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see [Device Credentials Page, page 3-44](#).

**Note**

You can discover encrypted passwords, but any password you enter must be in clear text. If you discover an encrypted password and then modify it, the password is saved as clear text.

**Related Topics**

- [User Accounts and Device Credentials on Cisco IOS Routers, page 60-13](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Accounts and Credentials** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Accounts and Credentials** from the Policy Type selector. Select an existing policy or create a new one.

The Accounts and Credentials page is displayed. See [Table 60-7 on page 60-16](#) for a description of the fields on this page.

**Step 2** Enter the password for switching to privileged EXEC mode on the router:

- Select **Enable Password** or **Enable Secret Password**. The Enable Secret Password option offers better security than the Enable Password option by storing the password using MD5 encryption. This option is useful in environments in which the password crosses the network or is stored on a TFTP server.

**Note**

After you set an enable secret password, you can switch to an enable password only if the enable secret is disabled or an older version of Cisco IOS software is being used, such as when running an older rxboot image.

- b. Enter a password, then enter it again in the Confirm field. The password that you enter must be in clear text. If you are configuring the enable secret password, the password is encrypted on deployment.

**Step 3** (Optional) Select the **Enable Password Encryption Service** check box to encrypt all passwords on the device. This includes, for example, the enable password, username passwords, authentication key passwords, console and VTY line access passwords, and BGP neighbor passwords.

We recommend using this feature to help prevent unauthorized individuals from viewing the passwords in your configuration file.

---

**Note** This option does not provide a high level of security and should not be used as a substitute for additional network security measures.

---

**Step 4** To define new user accounts for the router:

- a. Click the **Add** button under the table to display the User Accounts dialog box.
- b. Enter the details for the new user. See [Table 60-8 on page 60-17](#) for a description of the available fields.
- c. Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the User Accounts table.

---

**Note** To edit a user account, select it from the User Accounts table, then click **Edit**. To remove a user account, select it, then click **Delete**.

---

## Accounts and Credentials Policy Page

Use the Accounts and Credentials page to define the enable password or enable secret password assigned to the router. In addition, you can define a list of usernames that can be used to access the router.

For more information, see [Defining Accounts and Credential Policies, page 60-14](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Accounts and Credentials** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Accounts and Credentials** from the Policy Type selector. Right-click **Accounts and Credentials** to create a policy, or select an existing policy from the Shared Policy selector.

## Field Reference

Table 60-7 Accounts and Credentials Page

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Secret Password             | <p>The enable secret password for entering privileged EXEC mode on the router. This option offers better security than the Enable Password option.</p> <p>The enable secret password can contain between 1-25 alphanumeric characters. The first character must be a letter. Spaces are allowed, but leading spaces are ignored. Question marks are also allowed.</p> <p><b>Note</b> You can discover an encrypted password, but any password you enter must be in clear text. If you modify an encrypted password, it is saved as clear text.</p> <p><b>Note</b> After you set an enable secret password, you can switch to an enable password only if the enable secret is disabled or an older version of Cisco IOS software is being used, such as when running an older rxboot image.</p> |
| Enable Password                    | <p>The enable password for entering privileged EXEC mode on the router.</p> <p>The enable password can contain between 1-25 alphanumeric characters. The first character must be a letter. Spaces are allowed, but leading spaces are ignored. Question marks are also allowed.</p> <p><b>Note</b> You must enter the password in clear text.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Password Encryption Service | <p>When selected, encrypts all passwords on the device, including the enable password (which is otherwise saved in clear text).</p> <p>For example, use this option to encrypt username passwords, authentication key passwords, console and VTY line access passwords, and BGP neighbor passwords. This command is primarily used for keeping unauthorized individuals from viewing your passwords in your configuration file.</p> <p>When deselected, device passwords are stored unencrypted in the configuration file.</p> <p><b>Note</b> This option does not provide a high level of network security. You should also take additional network security measures.</p>                                                                                                                    |
| User Accounts Table                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Username                           | The username that can be used to access the router. The username must be a single word up to 64 characters in length. Spaces and quotation marks are not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Encryption                         | Indicates whether password information for the user is encrypted using MD5 encryption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Privilege Level                    | The privilege level assigned to the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Add button                         | Opens the <a href="#">User Account Dialog Box, page 60-17</a> . From here you can define a user account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Edit button                        | Opens the <a href="#">User Account Dialog Box, page 60-17</a> . From here you can edit the selected user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Delete button                      | Deletes the selected user accounts from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## User Account Dialog Box

Employ the User Account dialog box to define a username and password combination that can be used by Security Manager to access the router. You can also define the privilege level of the user account, which determines whether you can configure all commands on this router or only a subset of them.

### Note

Remember—there may be additional user accounts defined on the router using other methods, such as the CLI.

### Navigation Path

Go to the [Accounts and Credentials Policy Page, page 60-15](#), then click the **Add** or **Edit** button beneath the table.

| Username                   | The username for accessing the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password                   | The password for accessing the router with this user account.<br><b>Note</b> You can discover an encrypted password, but any password you enter must be in clear text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Confirm                    | Confirms the password for this user account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Encrypt password using MD5 | When selected, uses MD5 encryption to encrypt the password for this user account. This is the default.<br>When deselected, the password is sent to the router unencrypted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Privilege Level            | The privilege level assigned to the user account. Valid values range from 0 to 15: <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig. |

## Bridging on Cisco IOS Routers

Bridging policies enable you to perform transparent bridging (as specified in RFC 1286) on selected interfaces that you have configured to function as a bridge group. Security Manager supports integrated routing and bridging, which makes it possible to route a specific protocol between routed interfaces and bridge groups, or route a specific protocol between bridge groups. Local or unroutable traffic can be bridged among the bridged interfaces in the same bridge group, while routable traffic can be routed to other routed interfaces or bridge groups, as shown in [Figure 60-1](#).

Using integrated routing and bridging, you can:

- Switch packets from a bridged interface to a routed interface.
- Switch packets from a routed interface to a bridged interface.
- Switch packets within the same bridge group.

**Figure 60-1** Transparent Bridging

## Bridge-Group Virtual Interfaces

Because bridging takes place at the data link layer and routing takes place at the network layer, they have different protocol configuration models. With IP, for example, bridge group interfaces belong to the same network and have a collective IP network address. In contrast, each routed interface represents a distinct network and has its own IP network address. Integrated routing and bridging uses the concept of a bridge-group virtual interface (BVI) to enable these interfaces to exchange packets for a given protocol. As shown in [Figure 60-2](#), the interface number assigned to the BVI corresponds to the bridge group that the BVI represents. This number serves as the link between the virtual interface and the bridge group.

**Figure 60-2 Bridge-Group Virtual Interface**

When you enable routing for a given protocol on the BVI, packets coming from a routed interface that are destined for a host in a bridged domain are routed to the BVI and then forwarded to the corresponding bridged interface. All traffic routed to the BVI is forwarded to the corresponding bridge group as bridged traffic. All routable traffic received on a bridged interface is routed to other routed interfaces as if it is coming directly from the BVI.

**Note**

BVI interfaces are configured using the Interfaces policy. See [Defining Basic Router Interface Settings, page 59-3](#). The BVI interface must have a corresponding bridge group with the same number; otherwise, deployment will fail.

**Note**

When the bridge group contains more than two interfaces, add a BVI interface to the group to help prevent unicast flooding, which is a potential security issue.

- [Defining Bridge Groups, page 60-19](#)
- [Bridging on Cisco IOS Routers, page 60-18](#)

## Defining Bridge Groups

You define a bridge group by selecting the L3 interfaces that are part of the bridge group and assigning the group a number. All bridge groups in Security Manager perform integrated routing and bridging on IP traffic only and use the standard Spanning Tree Protocol (IEEE 802.1D).

**Note**

Use CLI commands or FlexConfigs to bridge other protocols, such as AppleTalk or IPX, and to use other spanning tree protocols, such as VLAN-Bridge. Concurrent routing and bridging is not supported.

**Related Topics**

- [Bridging on Cisco IOS Routers, page 60-18](#)
- [Bridge-Group Virtual Interfaces, page 60-18](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Bridging** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Bridging** from the Policy Type selector. Select an existing policy or create a new one.

The Bridging page is displayed. See [Table 60-9 on page 60-20](#) for a description of the fields on this page.

- Step 2** Click the **Add** button under the table to display the Bridge Group dialog box. See [Table 60-10 on page 60-21](#) for a description of the fields in this dialog box. From here you can define a bridge group.
- Step 3** Enter a number to identify the bridge group.
- Step 4** Enter the names of the interfaces and interface roles that are part of the bridge group, or click **Select** to select an interface role or to create a new one. For more information, see [Specifying Interfaces During Policy Definition, page 6-70](#).

You can select most Layer 3 interfaces, except X.25 and Integrated Services Digital Network (ISDN) bridged interfaces and certain types of logical interfaces (such as loopback, tunnel, null, and BVI). Each interface can be included in only one bridge group.

You can select a LAN subinterface only if the parent interface is configured with Inter-Switch Link (ISL) or 802.1Q encapsulation.

- Step 5** Click **OK** to save your definitions locally on the client and close the dialog box. The bridge group is displayed in the table on the Bridging page.

**Note** To edit a bridge group, select it from the Groups table, then click **Edit**. To remove a bridge group, select it, then click **Delete**.

## Bridging Policy Page

Use the Bridging page to define bridge groups that can perform integrated routing and bridging on the router. For more information, see [Defining Bridge Groups, page 60-19](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Bridging** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Bridging** from the Policy Type selector. Right-click **Bridging** to create a policy, or select an existing policy from the Shared Policy selector.

| Delete button | Deletes the selected bridge groups from the table.                                                       |

## Bridge Group Dialog Box

Use the Bridge Group dialog box to define bridge groups on the router. Each bridge group can contain multiple Layer 3 interfaces of various types, including serial interfaces.

### Note

All bridge groups use the standard Spanning Tree Protocol (IEEE 802.1D). Use CLI commands or FlexConfigs to bridge other protocols, such as AppleTalk or IPX, and to use other spanning tree protocols, such as VLAN-Bridge.

### Navigation Path

Go to the [Bridging Policy Page, page 60-20](#), then click the **Add** or **Edit** button beneath the table.

## Time Zone Settings on Cisco IOS Routers

The local time on a Cisco IOS router is typically set using the clock set command in the CLI command or by dynamically deriving the time from an NTP server. You can adjust these time settings by defining the time zone in which the router resides and the start and end dates of Daylight Saving Time (DST) in that time zone.

### Related Topics

- [Defining Time Zone and DST Settings, page 60-22](#)
- [NTP on Cisco IOS Routers, page 60-96](#)

## Defining Time Zone and DST Settings

Security Manager enables you to define the time zone in which a Cisco IOS router is located. You can also define the start and end dates for Daylight Saving Time (DST).

### Related Topics

- [Defining NTP Servers, page 60-97](#)
- [Time Zone Settings on Cisco IOS Routers, page 60-22](#)

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Clock** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Clock** from the Policy Type selector. Select an existing policy or create a new one.

The Clock page is displayed. See [Table 60-11 on page 60-24](#) for a description of the fields on this page.

- Step 2** Select the time zone in which the router is located. Time zones are listed according to the number of hours behind or ahead of Greenwich Mean Time (GMT).
- Step 3** (Optional) Select the method for determining the start and end dates for DST:
- Set by Date—Select this option when DST starts and ends on fixed dates. Continue with [Step 4](#).
  - Set by Day—Select this option when DST starts and ends on days whose specific dates vary from year to year. Continue with [Step 5](#).
  - None—Select this option when DST is not used.
- Step 4** (When Set by Date is selected) Define the fixed dates when DST starts and ends:
- a. Under Start, click the calendar icon, then click the appropriate date.
  - b. Select the hour and minute from the displayed lists.
  - c. Repeat steps a and b to configure the end date and time.
- Step 5** (When Set by Day is selected) Select the **Specify Recurring Time** check box if you want to define a DST period *other* than the default, which is the period used throughout most of the United States.
- Step 6** (When Specify Recurring Time is selected) Define the start and end of DST:
- a. Under Start, select the month when DST begins.
  - b. Select the week of the month (1, 2, 3, 4, first, or last).
  - c. Select the day of the week.
  - d. Select the hour and minute from the displayed lists. For example, if DST begins at 1:00 a.m. on the last Sunday of each March, select March, last, Sunday, 1, and 00.
  - e. Repeat Steps a through d to configure the end date and time.
- 

## Clock Policy Page

Use the Clock page to configure the time zone in which the router is located and the settings for Daylight Saving Time (DST). For more information, see [Time Zone Settings on Cisco IOS Routers, page 60-22](#).

### Tip

You can configure the local time on the router by defining an NTP policy or by configuring the **clock set** command using the CLI.

---

### Navigation Path

- (Device view) Select **Platform > Device Admin > Clock** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Clock** from the Policy Type selector. Right-click **Clock** to create a policy, or select an existing policy from the Shared Policy selector.

## CPU Utilization Settings on Cisco IOS Routers

The CPU policy configures settings relating to CPU utilization. This policy provides you with methods for monitoring CPU resources and tracking processes that exceed a predetermined level of utilization.

### Note

The CPU policy is supported on routers running Cisco IOS Software Release 12.3(14)T or later.

### Related Topics

- [Defining CPU Utilization Settings, page 60-25](#)

## Defining CPU Utilization Settings

You can use Security Manager to modify the following default CPU utilization settings:

- The size of the CPU history table.
- The size of the extended CPU load history table.
- Whether to enable the automatic CPU Hog profiling.

In addition, you can optionally define:

- The CPU utilization level that causes a process to be included in the history table.
- The types of CPU utilization thresholds to enable. For each type of threshold, you can determine the threshold values that trigger notifications.

### Related Topics

- [CPU Utilization Settings on Cisco IOS Routers, page 60-25](#)
- [Logging on Cisco IOS Routers, page 62-1](#)

### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > CPU** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > CPU** from the Policy Type selector. Select an existing policy or create a new one.

The CPU page is displayed.

- Step 2** (Optional) Define the CPU utilization settings of the router, as required. See [Table 60-12 on page 60-26](#) for a description of the available fields.

## CPU Policy Page

Use the CPU page to configure settings related to router CPU utilization, including the thresholds for sending log messages, the size of the CPU history table, and whether to enable automatic CPU Hog profiling.

For more information, see [Defining CPU Utilization Settings, page 60-25](#).

### Navigation Path

- (Device view) Select **Platform > Device Access > CPU** from the Policy selector.
- (Policy view) Select **Router Platform > Device Access > CPU** from the Policy Type selector. Right-click **CPU** to create a policy, or select an existing policy from the Shared Policy selector.

Valid values range from 5 to 86400 seconds (24 hours).</li> </ul> |
| Extended CPU History Size          | The size of the history to collect for the extended CPU load, in increments of 5 seconds. Valid values range from 2 to 720. The default is 12, which is equivalent to a 1-minute history.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Automatic CPU Hog Profiling | <p>When selected, automatic CPU Hog profiling is enabled. This is the default.</p> <p>When deselected, automatic CPU Hog profiling is disabled.</p> <p>This feature predicts when a process could hog the CPU and begins profiling that process.</p> <p><b>Note</b> To view the CPU Hog profile data, use the <b>show processes cpu autoprofile hog</b> command in the CLI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## HTTP and HTTPS on Cisco IOS Routers

Security Manager enables you to configure HTTP and HTTPS over Secure Socket Layer (known as HTTP over SSL or HTTPS) server functionality on Cisco IOS routers. This feature provides SSL version 3.0 support for the HTTP 1.1 server.

A secure HTTP connection means that data sent to and received from an HTTP server are encrypted before being sent out over the internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a router from a web browser.

In addition to providing access to the device via the Cisco web browser user interface, HTTP and HTTPS are used by device management applications, such as the Cisco Router and Security Device Manager (SDM), to communicate with the device.

### Related Topics

- [Defining HTTP Policies, page 60-29](#)

## Defining HTTP Policies

When you define an HTTP policy, you can:

- Enable and disable HTTP and SSL functionality on the router.
- Specify the ports used by each protocol.
- Optionally define a standard, numbered ACL that restricts access to the device using these protocols.

In addition, you can define the methods of AAA authentication and authorization methods to perform on users.

You must use caution when defining an HTTP policy, as your settings may affect communication between Security Manager (as well as other management applications that use these protocols) and the device.

### Note

As a general rule, Cisco IOS routers that have been discovered by Security Manager already have HTTPS enabled because Security Manager uses SSL as the default protocol for communicating with them. See [Setting Up SSL on Cisco IOS Routers, page 2-4](#).

### Before You Begin

- Enable AAA services on the router. See [Defining AAA Services, page 60-4](#).

### Related Topics

- [HTTP and HTTPS on Cisco IOS Routers, page 60-28](#)

### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Policy selector, then click the **Setup** tab in the work area.
- (Policy view) Select **Router Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Select an existing policy or create a new one.

The HTTP Setup tab is displayed. See [Table 60-13 on page 60-32](#) for a description of the fields on this tab.

### Step 2

Select the check boxes to enable HTTP and SSL (HTTPS) server functionality on the router.

### Note

If SSL is disabled (or if the HTTP policy as a whole is unassigned), Security Manager cannot communicate with the device after deployment unless you change the transport protocol for this device to SSH. This setting can be found in Device Properties. See [Managing Device Communication Settings and Certificates, page 9-4](#).

### Tip

We recommend that you disable HTTP when SSL is enabled. This is required to ensure only secure connections to the server.

### Step 3

(Optional) Modify the default ports used by HTTP (80) and HTTPS (443).

- Step 4** (Optional) In the Allow Connection From field, enter the name of the standard, numbered ACL object that specifies which addresses can use HTTP and HTTPS on this device, or click **Select** to select the ACL object from a list or to create a new one. Use this option to restrict access to these protocols. For more information about creating standard ACL objects, see [Creating Standard Access Control List Objects, page 6-51](#)

---

**Note** Make sure that the ACL you select permits the Security Manager server; otherwise, communication with the device is lost.

---

- Step 5** (Optional) On the AAA tab, modify the default type of authentication to perform on users who attempt to access the device using HTTP or HTTPS. Options include AAA, Enable Password (default), Local Database, and TACACS.

If you select AAA, continue with [Step 6](#); otherwise, continue with [Step 8](#).

---

**Note** The TACACS option applies only to devices using an IOS software version prior to 12.3(8).

---

See [Table 60-14 on page 60-33](#) for a description of the fields on the AAA tab.

- Step 6** Select the authentication method to perform on users:

- If you want to use the default AAA login authentication methods defined in the device's AAA policy (see [Defining AAA Services, page 60-4](#)), do *not* select the Enable Device Login Authentication check box. Continue with [Step 7](#).
- If you want to define a method list especially for this policy, do the following:
  - a. Select the **Enable Device Login Authentication** check box.
  - b. Under Prioritized Method List, enter the names of the AAA server groups to use for authentication, or click **Select** to select the AAA server groups from a list or to create new ones. Use the up and down arrows in the selector to define the order in which you want to apply these authentication methods.

---

**Note** Make sure that Security Manager users are defined on the AAA servers; otherwise communication with the device is lost.

---

- Step 7** Select the authorization method to perform on users who use HTTP or HTTPS to begin an EXEC session:

- If you want to use the default AAA authorization methods defined in the device's AAA policy, do *not* select the Enable CLI/EXEC Operations Authorization check box. Continue with [Step 8](#).
- If you want to define a method list especially for this policy, select the **Enable CLI/EXEC Operations Authorization** check box, then define the method list.

---

**Note** If you leave this option deselected, make sure that EXEC authorization is enabled in the router's AAA policy. Otherwise, you will be unable to connect to the device via HTTP or HTTPS (SSL). This applies to Security Manager as well as other applications, such as SDM. See [Defining AAA Services, page 60-4](#).

---

- Step 8** (Optional) Create command authorization definitions for specific privilege levels:
- Click the **Add** button under the Command Authorization Override table. The Command Authorization Override dialog box is displayed. See [Table 60-15 on page 60-34](#) for a description of the fields in this dialog box.
  - Configure the command authorization definition as required.
  - Click **OK**. The dialog box closes and the authorization method is displayed in the Command Authorization Override table.
  - Repeat [a.](#) through [c.](#) to create additional command authorization definitions.
- 

## HTTP Policy Page

Use the HTTP page to configure HTTP and HTTPS access on the router. You can configure HTTP policies on a Cisco IOS router from the following tabs on the HTTP policy page:

- [HTTP Page—Setup Tab, page 60-31](#)
- [HTTP Page—AAA Tab, page 60-32](#)

For more information, see [HTTP and HTTPS on Cisco IOS Routers, page 60-28](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Right-click **HTTP** to create a policy, or select an existing policy from the Shared Policy selector.

## HTTP Page—Setup Tab

Use the Setup tab of the HTTP page to enable HTTP and HTTP over Secure Socket Layer (HTTP over SSL or HTTPS) on the router. You can optionally limit access to these protocols to the addresses defined in an access control list.

### Note

As a general rule, Cisco IOS routers that have been discovered by Security Manager already have HTTPS enabled because Security Manager uses SSL as the default protocol for communicating with them. See [Setting Up SSL on Cisco IOS Routers, page 2-4](#).

---

### Navigation Path

Go to the [HTTP Policy Page, page 60-31](#), then click the **Setup** tab.

This is the default.</li> <li>• Local Database—Uses the local username database configured on the router.</li> <li>• TACACS—Uses the TACACS or XTACACS server configured on the router. Applies only to devices using an IOS software version prior to 12.3(8) or 12.3(8)T.</li> </ul>                                                                                                                                                                                                                                                                                                                        |
| Login Authentication settings            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable Device Login Authentication       | <p>Applies only when AAA is selected as the authentication method.</p> <p>When selected, authentication is based on the methods defined in the Prioritized Method List field.</p> <p>When deselected, the default authentication list defined in the router's AAA policy is used. See <a href="#">AAA Page—Authentication Tab, page 60-6</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Prioritized Method List                  | <p>Applies only when the Enable Device Login Authentication check box is selected.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| EXEC Authorization settings              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable CLI/EXEC Operations Authorization | <p>Applies only when AAA is selected as the authentication method.</p> <p>When selected, EXEC authorization is based on the methods defined in the Prioritized Method List field. This type of authorization determines whether the user is permitted to open an EXEC (CLI) session.</p> <p>When deselected, the default EXEC authorization list defined in the router's AAA policy is used. See <a href="#">AAA Page—Authorization Tab, page 60-7</a>.</p> <p><b>Note</b> If you leave this option deselected, make sure that EXEC authorization is enabled in the router's AAA policy. Otherwise, you will be unable to connect to the device via HTTP or HTTPS (SSL). This applies to Security Manager as well as other applications, such as SDM and the device's web interface.</p>                              |

| Prioritized Method List        | <p>Applies only when the Enable CLI/EXEC Operations Authorization check box is selected.</p> <p>Defines a sequential list of methods to be queried when authorizing a user to open an EXEC (CLI) session. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Command Authorization settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Privilege Level                | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Prioritized Method List        | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Add button                     | Opens the <a href="#">Command Authorization Override Dialog Box, page 60-34</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Edit button                    | Opens the <a href="#">Command Authorization Override Dialog Box, page 60-34</a> . From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Delete button                  | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Command Authorization Override Dialog Box

Use the Command Authorization Override dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

### Navigation Path

From the [HTTP Page—AAA Tab, page 60-32](#), click the **Add** button beneath the Command Authorization Override table.

### Related Topics

- [HTTP Policy Page, page 60-31](#)
- [AAA Policy Page, page 60-6](#)

### Field Reference

**Table 60-15** Command Authorization Dialog Box

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritized Method List | <p>Defines a sequential list of methods to be used when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p>Supported methods include TACACS+, Local, and None.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## Line Access on Cisco IOS Routers

Security Manager enables you to configure command line access (also called EXEC access) to a router using the following methods:

- Console port—Physical connection via a standard RS232 cable for local access. For more information, see:
  - [Defining Console Port Setup Parameters, page 60-35](#)
  - [Defining Console Port AAA Settings, page 60-37](#)
- VTY lines—Virtual terminal lines for remote access, typically using protocols such as Telnet, SSH, or rlogin. For more information, see:
  - [Defining VTY Line Setup Parameters, page 60-38](#)
  - [Defining VTY Line AAA Settings, page 60-40](#)

After you configure and deploy these policies, you can use these lines to communicate with individual devices directly when you want to configure or diagnose them using the CLI.

### Defining Console Port Setup Parameters

The console port on a router is generally used for local system access by an administrator with physical access to the device. By default, the console port is set up as follows:

- All permitted users have privileged access to the router, including all configuration commands (privilege level 15).
- The line is disconnected after 10 minutes without user input.
- Incoming connections are not permitted.
- Outgoing connections support Telnet only.

In addition to modifying any of the default settings, you can optionally define the following settings:

- The password for accessing the console.
- Whether to disable all EXEC sessions on the console.

- Incoming and outgoing ACLs that restrict the connections that are permitted on the console.
- Whether VRF connections are permitted on the console.

### Related Topics

- [Line Access on Cisco IOS Routers, page 60-35](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector, then click the **Setup** tab in the work area.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Setup** tab.
- The Console Setup tab is displayed. See [Table 60-16 on page 60-42](#) for a description of the fields on this tab.
- Step 2** (Optional) Enter the password for accessing the console port, then enter it again in the Confirm field.
- Step 3** (Optional) Modify the default (15) granted to users of the console port. See [Console Page—Authorization Tab, page 60-45](#).
- Step 4** (Optional) Select the **Disable all the EXEC sessions to the router via this line** check box to prevent any incoming connections via the console.

---

**Note** Selecting this option blocks all access to the device via the console port.

---

- Step 5** (Optional) Modify the default timeout after which the line is disconnected if no user input is detected.

---

**Note** Setting this value to 0 disables the timeout. Disabling the timeout could compromise the security of your network.

---

- Step 6** (Optional) Specify which protocols can be used for outbound connections on the console port:
- All—All supported protocols are permitted.
  - None—No protocols are permitted.
  - Protocol—Enables one or more of the following protocols: SSH, Telnet, and rlogin.

---

**Note** You must configure AAA authentication on devices where the console port permits the SSH and rlogin protocols. See [Defining Console Port AAA Settings, page 60-37](#).

---

- Step 7** (Optional) Enter the names of ACLs that restrict incoming and outgoing connections between the device and the addresses in these lists, or click **Select** to select the ACL object or to create a new one. At the top of the selector, in the Type field, select the ACL type as either Standard or Extended.
- Step 8** (Optional) Click the **AAA** tab to define authentication, authorization, and accounting settings for the console port. See [Defining Console Port AAA Settings, page 60-37](#).
-

## Defining Console Port AAA Settings

By default, authentication, authorization, and accounting are not performed on the console port. When you configure one or more of these access control options, you can either make use of the default method lists defined in the device's AAA policy or define a custom method list containing one or more AAA methods.

### Related Topics

- [Defining Console Port Setup Parameters, page 60-35](#)
- [Line Access on Cisco IOS Routers, page 60-35](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector, then click the **Authentication** tab in the work area.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Authentication** tab.

The Console Authentication tab is displayed.

- Step 2** (Optional) Select the authentication method to perform on users who attempt to access the console line. See [Table 60-17 on page 60-45](#) for a description of the fields on the Authentication tab.

---

**Note** If you select local authentication, preview the full configuration before deployment to make sure that the **aaa new-model** command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.

---

- Step 3** (Optional) On the Authorization tab, select the authorization method to perform on users who access the console line and begin an EXEC session.

See [Table 60-18 on page 60-46](#) for a description of the fields on the Authorization tab.

---

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

---

- Step 4** (Optional) Create command authorization definitions for specific privilege levels:
- a. Click the **Add** button under the Commands Authorization table. The Command Authorization dialog box is displayed. See [Table 60-26 on page 60-61](#) for details.
  - b. Configure the command authorization definition as required.
  - c. Click **OK**. The dialog box closes and the authorization method is displayed in the Commands Authorization table.
  - d. Repeat **a.** through **c.** to create additional command authorization definitions.

- Step 5** (Optional) On the Accounting tab, select the EXEC and connection accounting methods to perform on users who access the console line.

See [Table 60-19 on page 60-47](#) for a description of the fields on this tab.

- Step 6** (Optional) Create command accounting definitions for specific privilege levels:
- Click the **Add** button under the Commands Accounting table. The [Command Accounting Dialog Box—Line Access, page 60-61](#) is displayed.
  - Configure the command accounting definition as required.
  - Click **OK**. The dialog box closes and the accounting method is displayed in the Commands Accounting table.
  - Repeat [a.](#) through [c.](#) to create additional command accounting definitions.
- 

## Defining VTY Line Setup Parameters

All Cisco IOS routers are configured by default with five VTY lines (labeled 0-4) that have the following settings:

- All permitted users have privileged access to the router, including all configuration commands (privilege level 15).
- VTY lines are disconnected after 10 minutes without user input.
- Incoming connections are not permitted.
- Outgoing connections support Telnet only.

You can use Security Manager to modify the default settings on these five VTY lines or to configure additional lines (up to a maximum of 16). In addition, you can optionally configure the following settings on each line:

- The password for accessing the line.
- Whether to disable all EXEC sessions on the line.
- Incoming and outgoing ACLs that restrict the connections that are permitted on the line.
- Whether VRF connections are permitted on the line.

### Defining Groups of VTY Lines

You can configure multiple VTY lines as a contiguous group, which enables you to define identical settings for all the lines in the group with one procedure. All the lines within the group must fall within one of two ranges, 0-4 or 6-15. The group cannot overlap these two ranges.

The rules for configuring VTY line 5 are as follows. Line 5 can be part of the same definition as lines 0-4 only when there are no lines configured above line 5. If there are lines configured above line 5, you cannot include line 5 in the definition for lines 0-4, even if their configurations are the same. Line 5 *can* be included in the definition of the lines above line 5 if their configurations are the same.

For example, if lines 0-5 all share one configuration and lines 6-9 have a different configuration, you need to create three definitions—one definition for lines 0-4, a second definition for line 5, and a third definition for lines 6-9.

**Note**

When you configure VTY lines, bear in mind that users are assigned a line at random when they connect to the device.

---

**Note** You can create only one definition per VTY line. An error is displayed if you create a VTY line definition that overlaps an existing definition.

**Note** If you use Security Manager to configure the default VTY lines (0-4), your definition overrides the default settings on the device. If you later delete this definition from Security Manager, the input protocol settings are retained and the other default settings are restored. This ensures that you always have VTY lines available for remote access to the device.

**Note** You can use the CLI or FlexConfigs to configure additional VTY lines on devices that support more than 16 lines.

### Related Topics

- [Line Access on Cisco IOS Routers, page 60-35](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Select an existing policy or create a new one.
- The VTY page is displayed. See [Table 60-20 on page 60-50](#) for a description of the fields on this page.
- Step 2** Click the **Add** button beneath the Lines table, or select a line definition and then click the **Edit** button. The Setup tab of the VTY Lines dialog box is displayed. See [Table 60-21 on page 60-51](#) for a description of the fields on this tab.
- Step 3** Enter the relative line number of the VTY line. If you are configuring a group of VTY lines, enter the first and last numbers of the group in the fields provided.
- Step 4** (Optional) Enter the password for accessing the console line, then enter it again in the Confirm field.
- Step 5** (Optional) Modify the default Privilege (15) granted to users of this VTY line (or group of lines).
- Step 6** (Optional) Select the **Disable all the EXEC sessions to the router via this line** check box to prevent any incoming connections over this VTY line (or group of lines).
- Step 7** (Optional) Modify the default timeout after which the line is disconnected if no user input is detected.

**Note** Setting this value to 0 to disables the timeout. Disabling the timeout could cause abandoned sessions to block available VTY lines. It can also compromise the security of your network.

- Step 8** (Optional) Specify which protocols can be used for inbound and outbound connections on this VTY line (or group of lines):
- All—All supported protocols are permitted.
  - None—No protocols are permitted.
  - Protocol—Enables one or more of the following protocols: SSH, Telnet, and rlogin.

**Caution**

Setting the inbound connections setting to None might prevent Security Manager from connecting to the device after deployment.

**Note**

You must configure AAA authentication when the VTY line permits the SSH and rlogin protocols. See [Defining VTY Line AAA Settings, page 60-40](#).

**Step 9**

(Optional) Enter the names of ACLs that restrict incoming and outgoing connections between the device and the addresses in these lists, or click **Select** to select an ACL object from a list or to create a new one. You can choose from standard or extended ACLs.

**Tip**

Defining an inbound ACL is a good way to reserve a VTY line for administrative access only.

**Step 10**

(Optional) Click the **AAA** tab to define authentication, authorization, and accounting settings for this VTY line (or group of lines). See [Defining VTY Line AAA Settings, page 60-40](#).

**Step 11**

Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Lines table.

**Note**

To remove a VTY line definition, select it, then click **Delete**. If you delete a VTY line from an IOS device, any subsequent lines are also deleted. For example, if the device contains lines 0-9 and you delete line 5, lines 6-9 are deleted as well. If you delete the definition for lines 0-4 from Security Manager, the router retains the inbound protocol definition and restores the other default settings for these lines on the device. This ensures that five VTY lines are always available.

## Defining VTY Line AAA Settings

By default, authentication, authorization, and accounting are not performed on VTY lines. When you configure one or more of these access control options, you can either make use of the default method lists defined in the device's AAA policy or define a custom method list containing one or more AAA methods.

### Before You Begin

- Define the basic parameters of the VTY line or group of VTY lines. See [Defining VTY Line Setup Parameters, page 60-38](#).

### Related Topics

- [Defining VTY Line Setup Parameters, page 60-38](#)
- [Line Access on Cisco IOS Routers, page 60-35](#)

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Select an existing policy or create a new one.

The VTY page is displayed. See [Table 60-20 on page 60-50](#) for a description of the fields on this page.

**Step 2** Select a VTY line definition in the Lines tables, click the **Edit** button to display the VTY Line dialog box, then click the **Authentication** tab.

**Step 3** (Optional) Select the authentication method to perform on users who attempt to access the VTY line. See [Table 60-23 on page 60-55](#) for a description of the fields on this tab.

---

**Note** If you select local authentication, preview the full configuration before deployment to make sure that the **aaa new-model** command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.

---

**Step 4** (Optional) On the Authorization tab, select the authorization method to perform on users who access the VTY line and begin an EXEC session.

See [Table 60-24 on page 60-56](#) for a description of the fields on the Authorization tab.

---

**Note** RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.

---

**Step 5** (Optional) Create command authorization definitions for specific privilege levels:

- a. Click the **Add** button under the Commands Authorization table. The [Command Authorization Dialog Box—Line Access, page 60-60](#) is displayed.
- b. Configure the command authorization definition as required.
- c. Click **OK**. The dialog box closes and the authorization method is displayed in the Commands Authorization table.
- d. Repeat [a.](#) through [c.](#) to create additional command authorization definitions.

**Step 6** (Optional) On the Accounting tab, select the EXEC and connection accounting methods to perform on users who attempt to access the VTY line.

See [Table 60-25 on page 60-58](#) for a description of the fields on the Accounting tab.

**Step 7** (Optional) Create command accounting definitions for specific privilege levels:

- a. Click the **Add** button under the Commands Accounting table. The [Command Accounting Dialog Box—Line Access, page 60-61](#) is displayed.
  - b. Configure the command accounting definition as required.
  - c. Click **OK**. The dialog box closes and the accounting method is displayed in the Commands Accounting table.
  - d. Repeat [a.](#) through [c.](#) to create additional command accounting definitions.
-

# Console Policy Page

Use the Console page to configure access to the router over the console port. You can configure console policies on a Cisco IOS router from the following tabs on the Console policy page:

- [Console Page—Setup Tab, page 60-42](#)
- [Console Page—Authentication Tab, page 60-44](#)
- [Console Page—Authorization Tab, page 60-45](#)
- [Console Page—Accounting Tab, page 60-47](#)

For more information, see [Line Access on Cisco IOS Routers, page 60-35](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > Console** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > Console** from the Policy Type selector. Right-click **Console** to create a policy, or select an existing policy from the Shared Policy selector.

## Related Topics

- [VTY Policy Page, page 60-50](#)

## Console Page—Setup Tab

Use the Setup tab of the Console page to define the basic parameters of the console port. This includes the password for accessing the port, the privilege level assigned to users, the protocols that are permitted, and the ACLs that limit access.

## Navigation Path

Go to the [Console Policy Page, page 60-42](#), then click the **Setup** tab.

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level                                           | <p>The privilege level assigned to users connected to the console port. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p> |
| Disable all the EXEC sessions to the router via this line | <p>When selected, disables EXEC sessions over this line. Select this option when you want to allow only an outgoing connection on the console. This option is useful for keeping the console port free from unsolicited incoming data that can tie up the line.</p> <p>When deselected, EXEC sessions are enabled on the console port. This is the default.</p> <p><b>Note</b> Selecting this option blocks all access to the device via the console port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Exec Timeout                                              | <p>The amount of time (in seconds) that the EXEC command interpreter waits to detect user input on the console port. If no input is detected, the line is disconnected. Valid values range from 0 to 2147483. The default is 600 (10 minutes). Setting the value to 0 disables the timeout.</p> <p><b>Note</b> Although the timeout is defined in seconds, it appears in the CLI in the format [mm ss].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 60-16 Console Page—Setup Tab (Continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output Protocols                 | <p>The protocols that you can use for outgoing connections on the console port:</p> <ul style="list-style-type: none"> <li>All—All supported protocols are permitted. Supported protocols include LAT, MOP, NASI, PAD, rlogin, SSH, Telnet, and V.120.</li> <li>None—No protocols are permitted. This makes the port unusable by outgoing connections.</li> <li>Protocol—Enables one or more of the following protocols: <ul style="list-style-type: none"> <li>SSH—Secure Shell protocol.</li> <li>Telnet—Standard TCP/IP terminal emulation protocol.</li> <li>rlogin—UNIX rlogin protocol.</li> </ul> </li> </ul> <p><b>Note</b> SSH and rlogin require that you configure AAA authentication. See <a href="#">Console Page—Authentication Tab, page 60-44</a>.</p> <p><b>Note</b> Not all IOS Software Versions support rlogin as an output protocol.</p> |
| Inbound Access List              | <p>The name of the ACL object that restricts incoming connections on the console port. Enter the name of the ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Permit VRF Interface Connections | <p>Applies only when an inbound ACL is defined on the console port. When selected, accepts incoming connections from interfaces that belong to a VRF. When deselected, rejects incoming connections from interfaces that belong to a VRF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Outbound Access List             | <p>The name of the ACL object that restricts outgoing connections on the console port. Enter the name of an ACL object, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Console Page—Authentication Tab

Use the Authentication tab of the Console page to define the AAA authentication methods to perform on users who attempt to access the console port.

### Navigation Path

Go to the [Console Policy Page, page 60-42](#), then click the **Authentication** tab.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authenticate Using      | <p>Authentication settings for the console port:</p> <ul style="list-style-type: none"> <li>• None—Authentication is not performed. This is the default.</li> <li>• Local Database—Uses the local username database for authentication.</li> <li>• AAA Policy Default List—Uses the default authentication method list that is defined in the device's AAA policy. See <a href="#">AAA Page—Authentication Tab, page 60-6</a>.</li> <li>• Custom Method List—Uses the authentication methods specified in the Authentication Method List field.</li> </ul> <p><b>Note</b> If you select local authentication, preview the full configuration before deployment to make sure that the <b>aaa new-model</b> command is not configured by another policy (for example, by configuring a method list in the AAA policy) or is already configured on the device itself.</p> |
| Prioritized Method List | <p>Applies only when Custom Method List is selected as the authentication method.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p>                                                   |

## Console Page—Authorization Tab

Use the Authorization tab of the Console page to define the EXEC and command authorization methods to perform on users who access the console port.

**Note**

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services, page 60-4](#).

**Navigation Path**

Go to the [Console Policy Page, page 60-42](#), then click the **Authorization** tab.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXEC Authorization settings     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Authorize EXEC Operations Using | <p>The authorization method that determines whether a user is allowed to run an EXEC session:</p> <ul style="list-style-type: none"> <li>• None—Authorization is not performed. This is the default.</li> <li>• AAA Policy Default List—Uses the default authorization method list that is defined in the device’s AAA policy. See <a href="#">AAA Page—Authorization Tab, page 60-7</a>.</li> <li>• Custom Method List—Uses the authorization methods specified in the EXEC Method List field.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Prioritized Method List         | <p>Applies only when Custom Method List is selected as the EXEC method.</p> <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> <p><b>Note</b> RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.</p> |
| Command Authorization settings  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Privilege Level                 | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Prioritized Method List         | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Add button                      | Opens the <a href="#">Command Authorization Dialog Box—Line Access, page 60-60</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element       | Description                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit button   | Opens the <a href="#">Command Authorization Dialog Box—Line Access</a> , page 60-60. From here you can edit the command authorization definition. |
| Delete button | Deletes the selected command authorization definitions from the table.                                                                            |

## Console Page—Accounting Tab

Use the Accounting tab of the Console page to define the EXEC, connection, and command accounting methods to perform on users who access the console port.

### Note

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services](#), page 60-4.

### Navigation Path

Go to the [Console Policy Page](#), page 60-42, then click the **Accounting** tab.

| Command Accounting settings          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Privilege Level                      | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Generate Accounting Records for      | The points in the process where the device sends an accounting notice to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Broadcast                     | Whether accounting records are broadcast to multiple servers simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Prioritized Method List              | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 60-19 Console Page—Accounting Tab (Continued)**

| Element       | Description                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Add button    | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 60-61</a> . From here you can configure a command accounting definition. |
| Edit button   | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 60-61</a> . From here you can edit the command accounting definition.    |
| Delete button | Deletes the selected command accounting definitions from the table.                                                                            |

## VTY Policy Page

Use the VTY page to configure up to 16 VTY lines for remote access to the router. In addition to configuring individual lines, you can configure a group of lines that share the same definition.

For more information, see [Line Access on Cisco IOS Routers, page 60-35](#).

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Line Access > VTY** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Line Access > VTY** from the Policy Type selector. Right-click **VTY** to create a policy, or select an existing policy from the Shared Policy selector.

### Field Reference

**Table 60-20 VTY Lines Page**

| Element                    | Description                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Line                       | The relative line number of the VTY line. This field may also contain multiple VTY lines configured as a contiguous group. |
| Line/Line Group Parameters |                                                                                                                            |
| Input Protocols            | The protocols that you can use for incoming connections on the VTY line.                                                   |
| Output Protocols           | The protocols that you can use for outgoing connections on the VTY line.                                                   |
| Privilege Level            | The privilege level assigned to users.                                                                                     |
| Exec Timeout               | The amount of time the EXEC command interpreter waits until user input is detected.                                        |
| Inbound ACL                | The ACL used to limit inbound traffic.                                                                                     |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Outbound ACL          | The ACL used to limit outbound traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Authentication        | The type of AAA authentication used.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Authorization         | The types of AAA authorization used.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Accounting            | The types of AAA accounting used.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VTY Line Page Buttons |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Add button            | Opens the <a href="#">VTY Line Dialog Box, page 60-51</a> . From here you can define a VTY line or line group.                                                                                                                                                                                                                                                                                                                                                                              |
| Edit button           | Opens the <a href="#">VTY Line Dialog Box, page 60-51</a> . From here you can edit the VTY line or line group.                                                                                                                                                                                                                                                                                                                                                                              |
| Delete button         | Deletes the selected VTY lines from the table.<br><br>If you delete a VTY line from an IOS device, any subsequent lines are also deleted. For example, if the device contains lines 0-9 and you delete line 5, lines 6-9 are deleted as well.<br><br><b>Note</b> If you delete any of the default VTY lines (0-4) on the device, the input protocol settings are retained and the other default settings are restored. This helps prevent you from cutting off remote access to the device. |

## VTY Line Dialog Box

Use the VTY Line dialog box to configure one or more VTY lines (up to 16) that enable remote users to access the router. When you configure a VTY line, you can define the type of authentication and authorization to perform on users who access the lines.

### Navigation Path

Go to the [VTY Policy Page, page 60-50](#), then click the **Add** or **Edit** button beneath the table.

## VTY Line Dialog Box—Setup Tab

Use the Setup tab of the VTY Line dialog box to define the basic parameters of the VTY line. This includes the password for accessing the line, the privilege level assigned to users, the protocols that are permitted on the line, and the ACLs that limit access.

### Navigation Path

Go to the [VTY Line Dialog Box, page 60-51](#), then click the **Setup** tab.

|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password                                                  | <p>The password for accessing this VTY line.</p> <p>The password is case sensitive and can contain up to 80 alphanumeric characters. The first character cannot be a number. Spaces are not allowed.</p> <p>Enter the password again in the Confirm field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Privilege Level                                           | <p>The privilege level assigned to users on this VTY line. Valid values range from 0 to 15:</p> <ul style="list-style-type: none"> <li>• 0—Grants access to these commands only: <b>disable</b>, <b>enable</b>, <b>exit</b>, <b>help</b>, and <b>logout</b>.</li> <li>• 1—Enables nonprivileged access to the router (normal EXEC-mode use privileges).</li> <li>• 15—Enables privileged access to the router (traditional enable privileges).</li> </ul> <p><b>Note</b> Levels 2-14 are not normally used in a default configuration, but custom configurations can be created by moving commands that are normally at level 15 to a lower level and commands that are normally at level 1 to a higher level. You can configure the privilege levels of commands using the CLI or by defining a FlexConfig.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p> |
| Disable all the EXEC sessions to the router via this line | <p>When selected, EXEC sessions are disabled over this line. Select this option when you want to allow only an outgoing connection on this line. This option is useful for keeping a particular line free from unsolicited incoming data that can tie up the line.</p> <p>When deselected, EXEC sessions are enabled over this line. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Exec Timeout                                              | <p>The amount of time (in seconds) that the EXEC command interpreter waits to detect user input on the line. If no input is detected, the line is disconnected. Valid values range from 0 to 2147483. The default is 600 (10 minutes). Setting the value to 0 disables the timeout.</p> <p><b>Note</b> Although the timeout is defined in seconds, it appears in the CLI in the format [mm ss].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## VTY Line Dialog Box—Authentication Tab

Use the Authentication tab of the VTY Line dialog box to define the authentication methods to perform on users who attempt to access the selected VTY line or group of lines.

### Navigation Path

Go to the [VTY Line Dialog Box](#), page 60-51, then click the **Authentication** tab.

| Prioritized Method List | <p>Applies only when Custom Method List is selected as the authentication method.</p> <p>Defines a sequential list of methods to be queried when authenticating a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authenticate users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |

## VTY Line Dialog Box—Authorization Tab

Use the Authorization tab of the VTY Line dialog box to define the EXEC and command authorization methods to perform on users who access the selected VTY line or group of lines.

### Note

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services, page 60-4](#).

### Navigation Path

Go to the [VTY Line Dialog Box, page 60-51](#), then click the **Authorization** tab.

| Prioritized Method List         | <p>Applies only when Custom Method List is selected as the EXEC method.</p> <p>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> <p><b>Note</b> RADIUS uses the same server for authentication and authorization. Therefore, if you use define a RADIUS method list for authentication, you must define the same method list for authorization.</p> |
| Command Authorization settings  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Privilege Level                 | The privilege level to which the command authorization definition applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Prioritized Method List         | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Add button                      | Opens the <a href="#">Command Authorization Dialog Box—Line Access, page 60-60</a> . From here you can configure a command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit button                     | Opens the <a href="#">Command Authorization Dialog Box—Line Access, page 60-60</a> . From here you can edit the command authorization definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Delete button                   | Deletes the selected command authorization definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## VTY Line Dialog Box—Accounting Tab

Use the Accounting tab of the VTY Line dialog box to define the EXEC, connection, and command accounting methods to perform on users who access the selected VTY line or group of lines.

**Note**

You must enable AAA services on the router to use this feature; otherwise, deployment will fail. See [Defining AAA Services, page 60-4](#).

**Navigation Path**

Go to the [VTY Line Dialog Box, page 60-51](#), then click the **Accounting** tab.

| Generate Accounting Records for      | The points in the process where the device sends an accounting notice to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Broadcast                     | Whether accounting records are broadcast to multiple servers simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Prioritized Method List              | The method list to use when authorizing users with this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Add button                           | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 60-61</a> . From here you can configure a command accounting definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit button                          | Opens the <a href="#">Command Accounting Dialog Box—Line Access, page 60-61</a> . From here you can edit the command accounting definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Delete button                        | Deletes the selected command accounting definitions from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Command Authorization Dialog Box—Line Access

Use the Command Authorization dialog box to define which methods to use when authorizing the EXEC commands that are associated with a given privilege. This enables you to authorize all commands associated with a specific privilege level, from 0 to 15.

**Navigation Path**

From the [Console Page—Authorization Tab, page 60-45](#) or the [VTY Line Dialog Box—Authorization Tab, page 60-56](#), click the **Add** button beneath the Command Authorization table.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level         | The privilege level for which you want to define a command authorization list. Valid values range from 0 to 15.<br><br><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AAA Policy Default List | Select this option to apply the default authorization list defined in the device's AAA policy to the EXEC commands associated with this privilege level. See <a href="#">Command Accounting Dialog Box, page 60-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Custom Method List      | Select this option to define an authorization method list for this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Prioritized Method List | Applies only when the Custom Method List option is selected.<br><br>Defines a sequential list of methods to be queried when authorizing a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.<br><br>The device tries initially to authorize users using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.<br><br><b>Note</b> If you select None as a method, it must appear as the last method in the list. |

**Command Accounting Dialog Box—Line Access**

Use the Command Accounting dialog box to define which methods to use when recording information about the EXEC commands that are executed for a given privilege. Each accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the name of the user who executed it.

**Navigation Path**

From the [Console Page—Accounting Tab, page 60-47](#) or the [VTY Line Dialog Box—Accounting Tab, page 60-57](#), click the **Add** button beneath the Command Accounting table.

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privilege Level                      | <p>The privilege level for which you want to define a command accounting list. Valid values range from 0 to 15.</p> <p><b>Note</b> If you do not define a value, level 1 is assigned by default. This value does not appear in the device configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| AAA Policy Default List              | Select this option to apply the default accounting list defined in the device's AAA policy to the EXEC commands executed for this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Custom Method List                   | Select this option to define an accounting method list for this privilege level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Generate Accounting Records for      | <p>Applies only when Custom Method List is selected.</p> <p>Defines when the device sends an accounting notice to the accounting server:</p> <ul style="list-style-type: none"> <li>• Start and Stop—Generates accounting records at the beginning and the end of the user process. The user process begins regardless of whether the accounting server receives the “start” accounting record. This is the default.</li> <li>• Stop Only—Generates an accounting record at the end of the user process only.</li> <li>• None—No accounting records are generated.</li> </ul>                                                                                                                                                                                                                                               |
| Prioritized Method List              | <p>Applies only when the Custom Method List option is selected.</p> <p>Defines a sequential list of accounting methods to be used when creating accounting records for a user. Enter the names of one or more AAA server group objects (up to four), or click <b>Select</b> to select them. Use the up and down arrows in the object selector to define the order in which the selected server groups should be used. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> <p>The device tries initially to perform accounting using the first method in the list. If that method fails to respond, the device tries the next method, and so on, until a response is received.</p> <p><b>Note</b> If you select None as a method, it must appear as the last method in the list.</p> |
| Enable Broadcast to Multiple Servers | <p>Applies only when Custom Method List is selected.</p> <p>When selected, enables the sending of accounting records to multiple AAA servers. Accounting records are sent simultaneously to the first server in each AAA server group defined in the method list. If the first server is unavailable, failover occurs using the backup servers defined within that group.</p> <p>When deselected, accounting records are sent only to the first server in the first AAA server group defined in the method list.</p>                                                                                                                                                                                                                                                                                                        |

# Optional SSH Settings on Cisco IOS Routers

Secure Shell (SSH) is an application and a protocol that uses encryption to provide secure communication between a client and server. You can use SSH to connect remotely to a Cisco IOS router over a VTY line and establish an EXEC session. SSH is the recommended replacement for other protocols, such as Telnet and rlogin, in environments where security is a concern.

All Cisco IOS routers are required to have SSH configured before they can be added to Security Manager. This is because Security Manager uses SSH (in addition to SSL) to communicate with them. The SSH policy provides a way to modify selected default settings and configure selected optional settings.

## Related Topics

- [Defining Optional SSH Settings, page 60-63](#)
- [Chapter 2, “Preparing Devices for Management”](#)
- [Setting Up SSH, page 2-5](#)

## Defining Optional SSH Settings

SSH is configured by default with the following settings:

- Both SSH version 1 and SSH version 2 are supported.
- The negotiation phase is terminated if not completed successfully after 120 seconds.
- The router tries 3 times to authenticate SSH clients before disconnecting.

You can use Security Manager to modify these default settings and optionally configure the following settings:

- The source interface for SSH packets.
- The name of the RSA key pair to use.
- Whether to regenerate the key during the next deployment.

## Before You Begin

- Make sure that SSH is enabled on the router. See [Chapter 2, “Preparing Devices for Management”](#).
- Make sure that the VTY lines on the router allow inbound SSH traffic. See [Defining VTY Line Setup Parameters, page 60-38](#).
- Make sure that a hostname and domain name are configured on the router (unless you plan to use a different RSA key pair). You can use the CLI or the Hostname policy in Security Manager for this purpose. See [Hostnames and Domain Names on Cisco IOS Routers, page 60-77](#).

## Related Topics

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Policy selector.

- (Policy view) Select **Router Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Select an existing policy or create a new one.

The Secure Shell page is displayed. See [Table 60-28 on page 60-65](#) for a description of the fields on this page.

**Step 2** (Optional) Modify the following default settings:

- The version of SSH to support.
- The timeout for completing the negotiation phase of the SSH connection.
- The number of times to attempt authentication of the SSH client.

**Step 3** (Optional) In the Source Interface field, enter the name of the interface or interface role whose address should be used as the source interface for all SSH packets sent to SSH clients, or click **Select** to select an interface role object from a list or to create a new one. The source interface must have an IP address.

If you do not enter a value in this field, the address of the closest interface to the destination is used.

**Step 4** (Optional) Enter the name of the RSA key pair to use for SSH connections. If you do not enter a value in this field, the router uses the key pair that is based on the hostname and domain name.

**Tip** Use the CLI command `show crypto key mypubkey rsa` to display the names and values of each key pair configured on the device.

**Step 5** (Optional) Select the **Regenerate Key During Deployment** check box if you want the router to regenerate the RSA key pair used for SSH. This option is useful if you believe that the secrecy of the keys might be compromised. Enter the size of the modulus to use to regenerate the keys.

**Note** You must remember to return to this policy after deployment to deselect the check box. If you do not do this, a new key is generated during each deployment.

**Note** This option requires interaction with the device during deployment. Therefore, you should use it only when deploying to live devices, not when deploying to a file.

**Note** A key pair must already exist on the device *before* you select this option; otherwise, deployment will fail. (This will typically be the case, since IOS routers must have SSH enabled to be added to Security Manager.)

## Secure Shell Policy Page

Use the Secure Shell page to change the default SSH settings on the router and to define additional optional settings, if required.

For more information, see [Optional SSH Settings on Cisco IOS Routers, page 60-63](#).

**Note**

You must configure SSH on the device using CLI commands before adding the device to Security Manager. This is because Security Manager uses SSH (as well as SSL) to communicate with Cisco IOS routers. For more information, see [Setting Up SSH, page 2-5](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Right-click **Secure Shell** to create a policy, or select an existing policy from the Shared Policy selector.

|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RSA Key Pair                     | <p>The name of the RSA key pair to use for SSH connections.</p> <p>If you do not enter a value, the router uses the RSA key pair generated from its hostname and domain name. This is the default.</p> <p><b>Tip</b> Use the CLI command <b>show crypto key mypubkey rsa</b> to display the names and values of each key pair configured on the device. These are the valid names that can be entered in this field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Regenerate Key During Deployment | <p>When selected, regenerates the RSA key pair on the router during the next deployment. This option is useful if you are concerned that the secrecy of the keys might be compromised.</p> <p>When deselected, a new key pair is not generated.</p> <p><b>Note</b> This check box is <i>not</i> deselected automatically after deployment. If you do not return to this policy to deselect the check box, the key is regenerated each time you deploy.</p> <p><b>Note</b> This option requires interaction with the device during deployment. Therefore, you should use it only when deploying to live devices, not when deploying to a file.</p> <p><b>Note</b> A key pair must already exist on the device <i>before</i> you select this option; otherwise, deployment will fail. (This will typically be the case, since IOS routers must have SSH enabled in order to be added to Security Manager.)</p> |
| Modulus Size                     | <p>Applies only when the Regenerate Key check box is selected.</p> <p>The size of the modulus used to generate a new key pair. A larger modulus is more secure but takes longer to generate. Valid values range from 360 to 2048 bits. The default is 1024 bits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## SNMP on Cisco IOS Routers

Simple Network Management Protocol (SNMP) defines a standard way for network management stations or workstations to monitor the health and status of many types of devices, including switches, routers, and firewall devices. It comprises a protocol, a database-structure specification, and a set of management data objects. Each SNMP device or member is part of a *community*, which determines the access that each device has (read-only or read-write).

SNMP obtains information from the managed device through a Management Information Base (MIB). The MIB is a database of code blocks called MIB objects, each of which controls one specific function. The MIB object comprises MIB variables, which define the MIB object name, description, default value, and so forth. MIB objects are structured hierarchically in a MIB tree.

SNMP policies enable you to configure the behavior of the SNMP agent running on the router. The agent sends unsolicited information back to the SNMP host as events occur. These unsolicited messages, which are generated in response to significant, predetermined events on the router, are called traps.

The following topics describe the tasks you perform to create SNMP policies on Cisco IOS routers:

- [Defining SNMP Agent Properties, page 60-67](#)

- [Enabling SNMP Traps, page 60-68](#)

## Defining SNMP Agent Properties

When you define the properties of the SNMP agent, you must define the community string and community string type, as well as the address and properties of the SNMP host that receives the traps.

SNMP community strings are embedded passwords to MIBs, which store data about the router's operation and are meant to be available to authenticated remote users. Two types of community strings exist: "public" community strings, which provide read-only access to all objects in the MIB (except community strings themselves), and "private" community strings, which provide read-write access to all objects in the MIB (except community strings).

SNMP hosts receive the traps generated by the router. You must define the address, password, and port number for accessing the SNMP host, as well as the SNMP version being used. Security Manager supports SNMP version 1, version 2c (also called "community-based SNMP") and version 3, which offers authentication and encryption.

### Related Topics

- [SNMP on Cisco IOS Routers, page 60-66](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Select an existing policy or create a new one.
- The SNMP page is displayed. See [Table 60-29 on page 60-69](#) for a description of the fields on this page.
- Step 2** Define the community string needed to access the MIB:
- a. Under Permissions, click **Add** to display the Permission dialog box.
  - b. Define the string. See [Table 60-30 on page 60-70](#) for a description of the available fields.
  - c. Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Permissions table.
-  **Note** A warning is displayed if you attempt to edit or delete a community string that is in use by an SNMP host. If you continue with the operation, the device creates a private, read-only string that matches the definition for the host in the Trap Receiver table.
- 
- Step 3** Define the SNMP host that receives the traps generated by the SNMP agent:
- a. Under Trap Receiver, click **Add** to display the Trap Receiver dialog box.
  - b. Define the host. See [Table 60-31 on page 60-71](#) for a description of the available fields.
  - c. Click **OK** to save your definitions locally on the client and close the dialog box. Your definitions are displayed in the Trap Receiver table.
- Step 4** Under SNMP Server Properties, enter the location and contact information for the administrator responsible for routers configured with this SNMP policy.

This definition, which is text-only and does not affect the operation of the router, provides useful information to the manager of the SNMP host when the manager investigates a particular trap.

- Step 5** Click **Configure Traps** to display the SNMP Traps dialog box, which is used to select which traps to enable on the router. For more information, see [Enabling SNMP Traps, page 60-68](#).
- 

## Enabling SNMP Traps

The router immediately sends notifications, also called SNMP traps, to the designated SNMP host (management station) when a defined condition occurs, such as a link up, link down, or a syslog event.

To enable SNMP traps, select the check box next to each relevant trap. Certain check boxes activate multiple, related traps.

**Note** Each trap that you enable consumes system resources. To lessen the impact on system performance, select only those traps that you need for network monitoring.

---

### Related Topics

- [SNMP on Cisco IOS Routers, page 60-66](#)
- 

- Step 1** Open the SNMP page for defining SNMP server policies on Cisco IOS routers, as described in [Defining SNMP Agent Properties, page 60-67](#).

- Step 2** On the SNMP page, click **Configure Traps**. The SNMP Traps dialog box is displayed.

- Step 3** Select the check box next to each type of trap to enable. The traps are divided into the following four categories:

- Standard SNMP traps (for example, Authentication, Cold Start, and Warm Start).
- ISAKMP traps (related to Phase 1 of the IPsec process).
- IPsec traps (related to Phase 2 of the IPsec process).
- Other traps (includes syslog messages, protocol-related notifications, and CPU usage warnings).

See [Table 60-32 on page 60-73](#) for a description of the available traps.

**Note** You must add command-line interface (CLI) commands to fully implement the IP multicast and CPU traps. One method available for entering these commands is by using FlexConfigs. See [Chapter 7, “Managing FlexConfigs”](#).

---

**Tip** Click **Select All** to enable all traps displayed in the dialog box or **Deselect All** to disable all the traps.

---

- Step 4** Click **OK** to save your definitions locally on the client and close the dialog box.

**Tip** To configure SNMP traps not included in this dialog box, define a FlexConfig. See [Chapter 7, “Managing FlexConfigs”](#) for more information.

---

# SNMP Policy Page

Use the SNMP page to configure the parameters necessary to send traps from the router to a designated SNMP host. These traps are unsolicited messages that notify the SNMP host of important events occurring on the router.

For more information, see [Defining SNMP Agent Properties, page 60-67](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Right-click **SNMP** to create a policy, or select an existing policy from the Shared Policy selector.

**Table 60-31** *Trap Receiver Dialog Box*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host IP Address  | The IP address of the SNMP host receiving the traps generated by the router. Enter an IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new one.                                                                                                                                                                                                                                  |
| SNMP Version     | The version of SNMP to use—version 1, version 2c, or version 3.                                                                                                                                                                                                                                                                                                                                                                                         |
| Community String | Applies only when version 1 or version 2c is selected.<br>The password required to access the SNMP host. Enter the string again in the Confirm field.<br><b>Note</b> We recommend that you use one of the strings defined in the Permissions table as the password to the SNMP host. You may, however, enter a different password. String length ranges from 1 to 128 characters. Your entry does not appear in the Permissions table and is read-only. |

**Table 60-31** Trap Receiver Dialog Box (Continued)

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name       | <p>Applies only when version 3 is selected.</p> <p>The password required to access the SNMP host. Enter the string again in the Confirm field.</p> <p><b>Note</b> We recommend that you use one of the strings defined in the Permissions table as the password to the SNMP host. You may, however, enter a different password. String length ranges from 1 to 128 characters. Your entry does not appear in the Permissions table and is read-only.</p> |
| SNMPv3 Security | <p>Applies only when version 3 is selected.</p> <p>The level of security to apply to SNMP traffic:</p> <ul style="list-style-type: none"> <li>• No MD5, No DES—No packet authentication.</li> <li>• MD5 (auth)—MD5 authentication, but no encryption.</li> <li>• DES (priv)—MD5 authentication and DES encryption.</li> </ul>                                                                                                                            |
| UDP Port        | The port number for the SNMP host. The default is 162. Valid values range from 0 to 65535.                                                                                                                                                                                                                                                                                                                                                               |

## SNMP Traps Dialog Box

Use the SNMP Traps dialog box to select the events in the router that should generate SNMP traps. To lessen possible degradation of system performance, select only those traps that are needed for network monitoring purposes.

### Tip

You can configure SNMP traps not included in this dialog box by defining FlexConfigs. For more information, see [Understanding FlexConfig Policies and Policy Objects, page 7-2](#).

### Navigation Path

Go to the [SNMP Policy Page, page 60-69](#), then click **Configure Traps**.

## Field Reference

Table 60-32 SNMP Traps Dialog Box

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Standard SNMP Traps | <p>Enables or disables standard SNMP traps. Options are:</p> <ul style="list-style-type: none"> <li>• Cold start—Sends a trap when the router reinitializes in a way that could change the configuration of the SNMP agent (or any other trap-receiving entity).</li> <li>• Warm start—Sends a trap when the router reinitializes in a way that does not change the configuration of the SNMP agent (or any other trap-receiving entity).</li> <li>• Authentication—Sends a trap if an SNMP request from the SNMP host fails because of an invalid community string.</li> </ul>                                                                                                                                       |
| IPsec Traps         | <p>Enables or disables individual IPsec-related traps. Options are:</p> <ul style="list-style-type: none"> <li>• Cryptomap—Sends a trap when a crypto map entry is added to, or removed from, the device's crypto map set. Additionally, this option sends a trap when a crypto map set is attached to, or detached from, an active interface.</li> <li>• Too Many SAs—Sends a trap if an attempt is made to create a security association (SA) when there is insufficient memory on the device.</li> <li>• Tunnel—Sends a trap when an IPsec Phase 2 tunnel becomes active or inactive.</li> </ul> <p>For more information, see <a href="#">Understanding IPsec Proposals for Site-to-Site VPNs, page 25-18</a>.</p> |
| ISAKMP Traps        | <p>Enables or disables individual Internet Security Association and Key Exchange Protocol (ISAKMP) traps. Options are:</p> <ul style="list-style-type: none"> <li>• Policy—Sends a trap when an ISAKMP policy is created or deleted.</li> <li>• Tunnel—Sends a trap when a Phase 1 IKE tunnel becomes active or inactive.</li> </ul> <p>For more information, see <a href="#">Understanding IKE, page 25-5</a>.</p>                                                                                                                                                                                                                                                                                                   |

Table 60-32 SNMP Traps Dialog Box (Continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other Traps         | <p>Enables or disables additional SNMP traps. Options are:</p> <ul style="list-style-type: none"> <li>• Syslog—Sends syslog messages to the SNMP host.</li> <li>• TTY—Sends Cisco-specific notifications when a Transmission Control Protocol (TCP) connection closes.</li> <li>• BGP—Sends notifications when Border Gateway Protocol (BGP) state changes occur. See <a href="#">BGP Routing on Cisco IOS Routers, page 64-1</a>.</li> <li>• IP Multicast—(Applicable to multicast routers only) Sends a trap if the router fails to receive a defined number of heartbeat packets from heartbeat sources within a defined time interval.<br/>If you select IP Multicast, you must also manually configure the <b>ip multicast heartbeat</b> command on the device to configure the multicast address and heartbeat limits. You can use FlexConfigs to do this.</li> <li>• CPU—Sends a trap when CPU usage rises and remains above an upper threshold or falls and remains below a lower threshold.<br/>If you select CPU, you must also manually configure the <b>process cpu threshold type</b> command on the device to configure the thresholds. You can use FlexConfigs to do this.</li> <li>• HSRP—Sends Hot Standby Routing Protocol (HSRP) notifications.</li> </ul> |
| Select All button   | Enables all the SNMP traps displayed in the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Deselect All button | Disables all the SNMP traps displayed in the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## DNS on Cisco IOS Routers

The Domain Name System (DNS) is a distributed database in which you can map hostnames to IP addresses through the DNS protocol from a DNS server. Each unique IP address can have an associated hostname. DNS is what makes it possible to connect to hosts without having to know the 32-bit IP address of that host. The DNS server takes the provided hostname and translates it into the appropriate IP address.

In addition to the translation provided by remote DNS servers, you can configure Cisco IOS routers with a local host table containing static mappings of hosts to IP addresses. When commands such as connect, telnet, and ping are used, the router checks this host table before querying the DNS servers, which speeds the translation process.

By default, the DNS feature is enabled on all Cisco IOS routers.

## Defining DNS Policies

When you define a DNS policy in Security Manager, you can specify the remote DNS servers used by the router for hostname-to-address translations. In addition, you can define a static host table that contains local translations used exclusively by this device. Having selected addresses in this type of cache can speed the translation process by eliminating the need to query the DNS servers.

### Related Topics

- [DNS on Cisco IOS Routers, page 60-74](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > DNS** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > DNS** from the Policy Type selector. Select an existing policy or create a new one.

The DNS page is displayed. See [Table 60-33 on page 60-76](#) for a description of the fields on this page.

- Step 2** In the Servers field, enter the addresses of the DNS servers (up to 6) that can perform hostname-to-address translations for the router. You can use a combination of addresses and network/host objects, or click **Select** to display a selector. For more information, see [Specifying IP Addresses During Policy Definition, page 6-81](#).

**Tip** If the network you want is not listed in the selector, click the **Create** button or the **Edit** button in the selector to display the [Add or Edit Network/Host Dialog Box, page 6-77](#). From here you can create a network/host object to use in the policy.

- Step 3** (Optional) In the Hosts field, enter the static host mappings that you want to define in the router's host table:
- a. Click **Add** to display the [IP Host Dialog Box, page 60-76](#).
  - b. Enter the hostname to translate.
  - c. Enter up to three addresses or network/host objects, or click **Select** to display a selector. These are the addresses to which the router translates the hostname.
  - d. Click **OK**. The mapping is displayed in the Hosts field on the DNS page.
  - e. Repeat **a.** through **d.** to add more hosts to the host table.

**Note** To edit a host mapping, select the definition from the Hosts field, then click **Edit**. To remove a host mapping, select it, then click **Delete**.

- Step 4** (Optional) Deselect the **Domain Lookup** check box to disable DNS functionality on the router.
-

# DNS Policy Page

Use the DNS policy page to define the local IP host table and the Domain Name System (DNS) servers that the router should use for translating hostnames to IP addresses. You can also prevent the router from performing DNS lookups by disabling the DNS feature.

## Navigation Path

- (Device view) Select **Platform > Device Admin > DNS** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > DNS** from the Policy Type selector. Right-click **DNS** to create a policy, or select an existing policy from the Shared Policy selector.

To remove an entry, select it, then click <b>Delete</b>.</p> |
| Domain Lookup | <p>When selected, the router performs lookups on the defined DNS servers. This is the default.</p> <p>When deselected, lookups on remote DNS servers are disabled.</p>                                                                                                                                                                                                                                                                                                                                                      |

## IP Host Dialog Box

Use the IP Host dialog box to configure the host table on the router. This is the table of static, local mappings that the router uses to translate hostnames to IP addresses. If the router does not find the required entry in the host table, it queries the DNS servers that are defined on the DNS page.

## Navigation Path

Go to the [DNS Policy Page, page 60-76](#), then click **Add** under Hosts.

|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Name | The hostname to include in the router's local host table.                                                                                                                                                                                      |
| Addresses | The addresses to associate with the hostname. Enter one or more addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new object. You can define a maximum of three addresses per hostname. |

## Hostnames and Domain Names on Cisco IOS Routers

The Hostname policy configures the hostname and domain name of the selected router. After you deploy this policy, any changes that you made to the hostname and domain name are reflected in the Device Properties page (see [Viewing or Changing Device Properties, page 3-39](#)).

**Related Topics**

- [Defining Hostname Policies, page 60-77](#)

## Defining Hostname Policies

When you define a hostname policy, Security Manager updates the hostname and domain name fields in the Device Properties dialog box after deployment. See [Viewing or Changing Device Properties, page 3-39](#).

**Related Topics**

- [Hostnames and Domain Names on Cisco IOS Routers, page 60-77](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Platform > Device Admin > Hostname** from the Policy selector.
  - (Policy view) Select **Router Platform > Device Admin > Hostname** from the Policy Type selector. Select an existing policy or create a new one.
- The Hostname page is displayed. See [Table 60-35 on page 60-78](#) for a description of the fields on this page.
- Step 2** Enter the hostname for the router. Names must start with a letter, end with a letter or digit, and include only letters, digits, and hyphens. The maximum length is 63 characters.
- Step 3** Enter the domain name for the router. The router uses this domain name for RSA key generation and in policies when you do not enter the fully-qualified domain name.
-

# Hostname Policy Page

Use the Hostname page to define the hostname and domain name assigned to the router. For more information, see [Defining Hostname Policies, page 60-77](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Hostname** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Hostname** from the Policy Type selector. Right-click **Hostname** to create a policy, or select an existing policy from the Shared Policy selector.

# Memory Settings on Cisco IOS Routers

The Memory policy configures settings relating to router memory. This policy provides you with methods for monitoring memory consumption, including the ability to generate notification messages when available memory drops below predefined thresholds.

### Note

The Memory policy is supported on routers running Cisco IOS Software Release 12.3(14)T or later.

## Related Topics

- [Defining Router Memory Settings, page 60-78](#)

# Defining Router Memory Settings

You can use Security Manager to modify the following default memory settings:

- The number of hours that the router maintains the log of memory consumption.
- Whether to enable the Memory Allocation Lite feature.
- The amount of memory to reserve for critical system log messages.

In addition, you can define:

- The lower thresholds for processor and I/O memory. Log messages are sent when available memory drops below these thresholds.
- The types of sanity checks to perform.

The default is 24 (1 day).</p> <p><b>Note</b> The memory log is enabled by default and cannot be disabled.</p>                                                                                                                                                                                                                                                                        |
| Processor Threshold                      | <p>The processor memory threshold in kilobytes. When available processor memory falls below this threshold, a notification message is triggered. Valid values range from 1 to 4294967295 kilobytes (4096 gigabytes).</p> <p><b>Note</b> Another notification message is generated when available free memory rises to 5% above the threshold.</p>                                                                                                                                                                                                        |
| I/O Threshold                            | <p>The I/O memory threshold in kilobytes. When available processor memory falls below this threshold, a notification message is triggered. Valid values range from 1 to 4294967295 kilobytes (4096 gigabytes).</p> <p><b>Note</b> Another notification message is generated when available free memory rises to 5% above the threshold.</p>                                                                                                                                                                                                              |
| Memory Allocation Lite                   | <p>When selected, the “memory-allocation lite” (malloc_lite) feature on the router is enabled. This feature avoids excessive memory allocation overhead for situations where less than 128 bytes are required. This is the default.</p> <p>When deselected, the “memory-allocation lite” feature is disabled.</p> <p><b>Note</b> This feature is supported for processor memory pools only.</p>                                                                                                                                                          |
| Memory Region For Critical Notifications | <p>The amount of memory (in kilobytes) reserved for critical system log messages. Valid values range from 1 to 4294967295 kilobytes (4096 gigabytes), but the value you specify cannot exceed 25% of total memory.</p> <p>This option reserves a region of memory on the router so that the router can issue critical system log messages even when system resources are overloaded.</p>                                                                                                                                                                 |
| Perform Sanity Checks                    | <p>The types of sanity checks to perform:</p> <ul style="list-style-type: none"> <li>• Buffer—When selected, performs sanity checks on all buffers. Sanity checks are performed when a packet buffer is allocated and when the packet buffer is returned to the buffer pool.</li> <li>• Queue—When selected, performs sanity checks on all queues.</li> <li>• All—When selected, performs sanity checks on all buffers and queues.</li> </ul> <p><b>Note</b> Enabling any of these options may result in a slight degradation of router performance.</p> |

# Secure Device Provisioning on Cisco IOS Routers

Secure Device Provisioning (SDP) offers an integrated solution for streamlining VPN and network security deployment. SDP (previously called Easy Secure Device Deployment, or EzSDD) enables remote-site users to securely bootstrap their VPN device through an easy-to-use web interface, thereby easing the deployment burden, lowering costs, and shortening the network development cycle. For example, a telecommuter or small branch office user can remove a new device from its shipping package, plug it in, open a simple web management interface, and establish VPN connectivity, all within a period of just a few minutes.

For more information about SDP, see *Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI*, which can be found in *Cisco IOS Security Configuration Guide, Release 12.4T*.

## Note

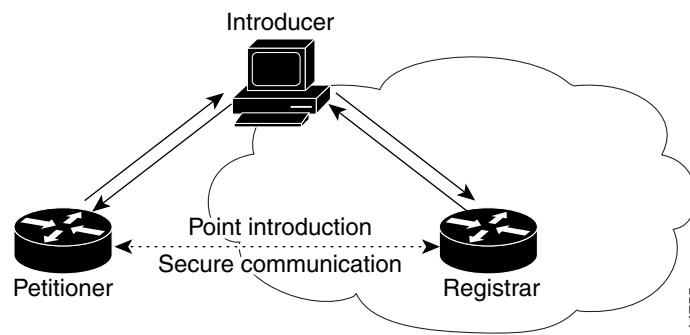

SDP requires Cisco IOS Software Release 12.3(8)T or later. Attempting to deploy this policy to a router running an earlier version could result in deployment failure. You also cannot configure the policy on NO-VPN router models (those that do not allow VPN configurations, such as the 3845 NOVPN).

Trusted Transitive Introduction (TTI) is the protocol that acts as the primary mechanism for implementing SDP. As shown in [Figure 60-3](#), TTI comprises the following three entities:

- **Introducer**—A mutually trusted device that introduces the petitioner to the registrar. Introducers can be end users who use SDP to deploy VPN devices associated with themselves to the PKI network, or an administrator/management system that uses SDP to deploy many VPN devices to the PKI network. This latter type is known as an administrative introducer. For more information, see [Configuring a AAA Server Group for Administrative Introducers, page 60-84](#).
- **Petitioner**—A remote-site device that is joined to the secure domain. The petitioner serves web pages to the introducer and receives the bootstrap configuration from the introducer's web browser. The petitioner component is enabled by default on all Cisco IOS devices.
- **Registrar**—A server that authorizes the petitioner by communicating directly with an authentication, authorization, and accounting (AAA) server to verify user credentials, permit or deny enrollment, and retrieve user-specific configuration information.

Use the SDP policy in Security Manager to configure the router as a registrar.

**Figure 60-3** Secure Device Provisioning

For more information about Secure Device Provisioning, see:

- [Contents of Bootstrap Configuration, page 60-82](#)
- [Secure Device Provisioning Workflow, page 60-82](#)

- [Defining Secure Device Provisioning Policies, page 60-83](#)

## Contents of Bootstrap Configuration

The bootstrap configuration provided by SDP typically does the following:

- Sets the petitioner's hostname.
- Synchronizes the petitioner's system clock with the registrar.
- Sets the petitioner's trustpoint.
- Sets the petitioner's authentication and authorization mechanism.
- Pushes the CA certificate.
- Enrolls the petitioner with the PKI server.
- Sets other VPN configurations, such as the configuration required to establish a management tunnel.
- Sets Cisco Networking Services (CNS) configuration.
- Sets the petitioner's DHCP pool.

## Secure Device Provisioning Workflow

The following illustrates the steps required to use SDP to register a remote-site device in a secure network:

1. Unpack the router and connect the power, LAN, and WAN cables.
2. Turn on a computer (introducer) that is assigned an IP address from the DHCP server on the router, open a web browser, and go to the petitioner URL (<http://device/ezsdd/welcome>) on the router. The router responds with a registration page (also called the local login dialog box).
3. Enter the username and password, then click **OK**. On the welcome page, enter the URL for the registrar. The following actions occur:
  - a. The browser opens an HTTPS-secured session to the central-site registrar, which verifies the username with the AAA server and returns the appropriate bootstrap configuration to the browser.
  - b. The browser feeds the bootstrap configuration to the remote-site router, configuring PKI trustpoint enrollment and IPsec VPN connectivity, and provisioning system attributes and other information.
  - c. You are notified that bootstrap configuration is complete.

## Defining Secure Device Provisioning Policies

The petitioner component is automatically enabled on all Cisco IOS routers. The SDP policy in Security Manager enables the registrar. To define an SDP policy you must define:

- The AAA server group containing the AAA server that the registrar uses to authenticate and authorize the introducer.
- The CA server to which the petitioner enrolls during the bootstrap process.
- The location of the introduction page that is displayed after authorization was performed.
- The location of the bootstrap configuration to be provided to the petitioner.

### Related Topics

- [Secure Device Provisioning Workflow, page 60-82](#)
- [Configuring a AAA Server Group for Administrative Introducers, page 60-84](#)
- [Secure Device Provisioning on Cisco IOS Routers, page 60-81](#)

---

**Step 1** Do one of the following:

- (Device view) Select **Platform > Device Admin > Secure Device Provisioning** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Secure Device Provisioning** from the Policy Type selector. Select an existing policy or create a new one.

The Secure Device Provisioning page is displayed. See [Table 60-37 on page 60-85](#) for a description of the fields on this page.

**Step 2** Under Introducer Authentication, enter the name of the AAA server group containing the relevant AAA server, or click **Select** to select it from a list or to create a new object.

The selected AAA server determines whether the username and password supplied by the introducer represent an authorized user. The AAA server must use TACACS+, RADIUS, or be local.

---

**Note** Each AAA server in the selected group must be configured to communicate with an interface that exists on the router; otherwise, validation fails. If you want to configure a different AAA server group for authenticating and authorizing administrative introducers, see [Configuring a AAA Server Group for Administrative Introducers, page 60-84](#).

---

**Step 3** Under Petitioner Authentication, define the CA server that authenticates the identity of the petitioner by doing one of the following:

- Select **Local CA Server**, then enter the local CA name in the field provided. If you have already configured the CA server locally on the registrar, a trustpoint is generated automatically.

---

**Note** If you have not configured the router as the CA server, enter the command **Crypto pki server [name]** using the CLI or FlexConfigs. This command is mandatory when you deploy an SDP policy configured with a local CA server.

---

- Select Remote CA Server, then enter the name of a PKI enrollment object, or click **Select** to select it from a list or to create a new object.

The PKI enrollment object defines the external CA server used in the SDP policy.

**Step 4** Select the source of the introduction page that is displayed after you log in to the registrar. The introduction page indicates whether authorization was successfully completed and contains a button for completing the process of obtaining the bootstrap configuration.

If you do not select the default welcome page, you must enter the URL required to access a different welcome page that you prepared elsewhere.

**Step 5** Select the source of the bootstrap configuration provided to the petitioner to implement its first-time configuration:

- If the source of the bootstrap configuration is a non-Security Manager URL, enter the URL and also the username and password for accessing the URL, if required.
- If the source of the configuration file is a Security Manager URL:
  - Enter the name of a FlexConfig, or click **Select** to select it from a list or to create a new object. The FlexConfig contains the device commands required to retrieve the appropriate bootstrap configuration. For more information, see [Add or Edit FlexConfig Dialog Box, page 7-29](#).
  - Enter the device name formula required by the FlexConfig to derive the device name of the petitioner from the username submitted by the introducer. (The two names typically have a fixed relationship.) The default formula is \$n, which uses the introducer name to determine the device name.
 

The device name determines which bootstrap configuration the petitioner should receive. The resulting URL contains the name of the FlexConfig you selected, as well as the parameters and formula you defined.
  - Enter a username and password for accessing the Security Manager server containing the FlexConfig. The password can contain alphanumeric characters, but cannot consist of a single digit.

## Configuring a AAA Server Group for Administrative Introducers

Administrative introducers are administrators or management systems that introduce many devices to the PKI network. You can configure a AAA server group for authenticating and authorizing administrative introducers by appending the following FlexConfig to the configuration of the router:

```
aaa new-model
radius-server host 1.2.3.4 auth-port 1645 acct-port 1646 key key
aaa group server radius default-radius-group2
server 1.2.3.4 auth-port 1645 acct-port 1646
exit
aaa authentication login CSM_SDP2 group default-radius-group2
crypto provisioning registrar
administrator authentication list CSM_SDP2
administrator authorization list CSM_SDP2
exit
```

This FlexConfig serves two functions—it configures the AAA server group to use and it associates this server group with the SDP crypto.

For more information about administrative introducers, see *Administrative Secure Device Provisioning Introducer* on Cisco.com at this URL:

## Secure Device Provisioning Policy Page

Secure Device Provisioning (SDP) policies (formerly known as Easy Secure Device Deployment or EzSDD) enable you to configure a Cisco IOS router as a *registrar*. This is the SDP component that retrieves bootstrap configurations for *petitioners*, which are remote-site devices that are enrolling in the network security infrastructure. These devices use the bootstrap configuration for first-time configuration purposes. The registrar also verifies the identity of the *introducer*, which is the user who introduces the petitioner to the registrar.

For more information, see [Defining Secure Device Provisioning Policies, page 60-83](#).

**Navigation Path**

- (Device view) Select **Platform > Device Admin > Secure Device Provisioning** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Secure Device Provisioning** from the Policy Type selector. Create a new policy or select an existing one.

Supported protocols include: FTP, HTTP, HTTPS, null, NVRAM, RCP, SCP, system, TFTP, Webflash, and XMODEM.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 60-37 Secure Device Provisioning Page (Continued)**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bootstrap Configuration | <p>The source of the bootstrap configuration to provide to the petitioner for first-time configuration:</p> <ul style="list-style-type: none"> <li>• Non-Security Manager URL—Used when the bootstrap configuration is located externally to Security Manager. Enter its location in the URL field.</li> </ul> <p>If required, enter a username and password to access the server containing the bootstrap configuration.</p> <ul style="list-style-type: none"> <li>• Security Manager URL—Used when Security Manager is providing the bootstrap configuration. Enter information in the following fields: <ul style="list-style-type: none"> <li>– FlexConfig—The FlexConfig that contains the basic CLI structure required to create the bootstrap configuration. Enter the name of a FlexConfig object, or click <b>Select</b> to display a selector.</li> </ul> <p>After selecting the FlexConfig, you must enter a username and password to access the Security Manager server that contains the FlexConfig.</p> <li>– Device name formula—The formula required by Security Manager to determine the device name of the petitioner from the username that the introducer supplied.</li> </li></ul> <p>Typically a fixed relationship exists between the username and the device name, which enables a formula like this to be established. The default formula is \$n, which uses the introducer name to determine the device name. The device name is required to determine the configuration file that the petitioner should receive.</p> <p>If required, enter a username and password to access the server containing the bootstrap configuration. The password can contain alphanumeric characters, but cannot consist of a single digit.</p> |

## DHCP on Cisco IOS Routers

In Security Manager, certain security features, such as Easy VPN and 802.1x, require Dynamic Host Configuration Protocol (DHCP) client/server configuration. DHCP is widely used in LAN environments to dynamically assign host IP addresses from a centralized server, which significantly reduces the overhead of administering IP addresses.

DHCP servers assign and manage IP addresses from specified address pools within a router to DHCP clients. If the DHCP server cannot satisfy a DHCP request from its own database, it can forward the request to one or more secondary DHCP servers defined by the network administrator.

Security Manager enables you to configure a Cisco IOS device as a DHCP server for clients (hosts) that are connected to the device's inside interface. When you configure a DHCP server, you use IP pools (a range of IP addresses reserved for a DHCP server). The IP pools you select determine the range of IP

addresses the server can use. These addresses are provided to client devices for a defined period of time called a lease. When this lease expires, the address is returned to the address pool, enabling the DHCP server to assign it to a different device.

For more information about DHCP, see:

- [Understanding DHCP Database Agents, page 60-88](#)
- [Understanding DHCP Relay Agents, page 60-88](#)
- [Understanding DHCP Option 82, page 60-89](#)
- [Understanding Secured ARP, page 60-89](#)

To configure a DHCP policy, see:

- [Defining DHCP Policies, page 60-90](#)
- [Defining DHCP Address Pools, page 60-91](#)

## Understanding DHCP Database Agents

A DHCP database agent is any external host—for example, an FTP, TFTP, or RCP server—that stores the DHCP bindings database. You can include one or more DHCP database agents in each DHCP policy, as well as configure the interval between database updates to the agent.

### Note

If you configure an external DHCP database agent, it is not necessary to define IP address pools, but you may do so. For more information about IP address pools, see [Defining DHCP Address Pools, page 60-91](#).

## Understanding DHCP Relay Agents

A DHCP relay agent is any host that forwards DHCP packets between clients and servers when they do not reside on the same physical subnet. Relay agents receive DHCP messages and then generate a new DHCP message to send on another interface. You can configure a reforwarding policy that determines what the DHCP relay agent should do if a forwarded message already contains relay information.

DHCP relay options in Security Manager include:

- Drop—The relay agent discards messages with existing relay information if Option 82 information is also present.
- Keep—The relay agent retains existing relay information.
- Replace—The relay agent overwrites existing information with its own relay information.

For example, you can have the DHCP relay agent replace the forwarded message with a new relay message. Additionally, you can choose whether to have the relay agent check the validity of relay information contained within forwarded BOOTREPLY messages.

## Understanding DHCP Option 82

DHCP option 82 enables the DHCP relay agent to include information about itself and its attached client when it forwards requests from a DHCP client to a DHCP server. The DHCP server can use this information to assign IP addresses, perform access control, and set quality of service (QoS) and security policies for each of its subscribers. When the DHCP option 82 feature is enabled, a subscriber is identified by the switch port through which it connects to the networks, instead of by its MAC address. Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified. Option 82 also enhances security on access switches by providing the ability to use a user's IP address to locate the port on which a user is attached.

## Understanding Secured ARP

The DHCP Secure IP Address Assignment feature (also called DHCP Authorized ARP) enables you to secure Address Resolution Protocol (ARP) table entries to DHCP leases in the DHCP database. This feature secures and synchronizes the client's MAC address to the DHCP binding, preventing unauthorized clients or hackers from spoofing the DHCP server and taking over a DHCP lease of an authorized client.

When you enable this feature and the DHCP server assigns an IP address to the DHCP client, the DHCP server adds a secure ARP entry to the ARP table with the assigned IP address and the MAC address of the client. These ARP entries cannot be updated by any other dynamic ARP packets, and they exist in the ARP table for as long as the lease is active.

Secure ARP entries can be deleted only by an explicit termination message from the DHCP client or by the DHCP server when the binding expires. To detect when a client has logged out, Secured ARP sends periodic ARP messages to which only authorized users can respond. Unauthorized responses are blocked at the DHCP server, providing an additional level of security.

**Note**

---

Secured ARP disables dynamic ARP learning on an interface.

## Defining DHCP Policies

When you configure a DHCP policy, you must define the IP address pools for the server to use to provide addresses to DHCP clients. In addition, you can optionally define the following:

- External DHCP database agent.
- IP ranges to exclude from DHCP.
- DHCP relay parameters.

**Note**

---

When configuring DHCP on a Cisco IOS router, make sure that the router does not contain an access rule denying Bootstrap Protocol (BootP) traffic. Having such a rule blocks DHCP traffic from being transmitted.

---

**Related Topics**

- [DHCP on Cisco IOS Routers, page 60-87](#)

**Step 1**

Do one of the following:

- (Device view) Select **Platform > Device Admin > Server Access > DHCP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Server Access > DHCP** from the Policy Type selector. Select an existing policy or create a new one.

The DHCP Policy page is displayed. See [Table 60-38 on page 60-92](#) for a description of the fields on this page.

**Step 2**

(Optional) Under Databases, click the **Add** button to display the [DHCP Database Dialog Box, page 60-94](#). From here you can define external DHCP database agents. For more information, see [Understanding DHCP Database Agents, page 60-88](#).

**Step 3**

(Optional) Under Excluded IPs, enter the IP addresses or address ranges within a DHCP address pool that should not be made available to DHCP clients. You can use a combination of addresses and network/host objects, or click **Select** to display a selector. For more information, see [Specifying IP Addresses During Policy Definition, page 6-81](#).

**Tip**

---

If the network you want is not listed in the selector, click the **Create** button to display the [Add or Edit Network/Host Dialog Box, page 6-77](#). From here you can create a network/host object.

---

- Step 4** Under IP Pools, click the **Add** button to display the [IP Pool Dialog Box, page 60-94](#). From here you can define the address pools to be used by the DHCP server. For more information, see [Defining DHCP Address Pools, page 60-91](#).
- Step 5** (Optional) When you use a relay agent to manage requests from DHCP clients located on a different subnet from the DHCP server, define the following DHCP relay options:
- Select the relay agent information reforwarding policy (Drop, Keep, or Replace). DHCP relay agents implement this policy when they receive messages already containing relay information.
  - Select the **Option** check box to enable the insertion of Option 82 data in requests that the relay agent forwards to the DHCP server.
  - Select the **Check** check box to validate DHCP Option 82 reply packets sent by the DHCP server.  
When you enable this option, invalid messages are dropped. Valid messages are stripped of the option-82 field before they are forwarded to the DHCP client. When you disable this option, the option-82 field is removed from the packet without being checked first for validity.  
See [Understanding DHCP Relay Agents, page 60-88](#) for more information.
- 

## Defining DHCP Address Pools

When you configure a DHCP policy that does not include an external database agent, you must define at least one IP address pool. This pool contains the addresses that the DHCP server can dynamically assign to DHCP clients. Additionally, you can define the following IP pool-specific options:

- The default routers, DNS servers, WINS servers, and domain used by DHCP clients.
- Whether to use the Secured ARP feature.
- Whether to import information regarding IP pool options from a centralized DHCP server.
- The length of the lease.
- The location of the TFTP server that IP telephony devices require to use addresses from this pool.

### Related Topics

- [Defining DHCP Policies, page 60-90](#)
- [DHCP on Cisco IOS Routers, page 60-87](#)

- 
- Step 1** On the DHCP page, click the **Create** button under IP Pools. The IP Pool dialog box is displayed.
- Step 2** Define the address pool. See [Table 60-40 on page 60-95](#) for a description of the available fields.
- Step 3** Click **OK** to save your definitions locally on the client and close the dialog box. The IP pool appears in the table displayed under IP Pools on the DHCP page.
- Step 4** Repeat [Step 1](#) through [Step 3](#) to define additional address pools, if required.

**Note** To edit an IP pool, select it from the table, then click the **Edit** button. To delete an IP pool, select it from the table, then click the **Delete** button. You cannot delete a pool whose addresses have been assigned to DHCP clients.

---

# DHCP Policy Page

Use the DHCP policy page to define a DHCP server policy on the selected router. This includes specifying the address pools used by the DHCP server when assigning addresses to requesting clients.

For more information, see [Defining DHCP Policies, page 60-90](#).

## Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP** from the Policy selector.
- (Policy view) Select **Router Platform > Device Admin > Server Access > DHCP** from the Policy Type selector. Right-click **DHCP** to create a policy, or select an existing policy from the Shared Policy selector.

| Database URL              | The URL of the external DHCP database agent.                                                                                                                                                                                                                                                                                                                                                                            |
| Timeout                   | The amount of time to wait (in seconds) for a response from the external DHCP database agent before aborting a database transfer.                                                                                                                                                                                                                                                                                       |
| Write Delay               | The interval (in seconds) between DHCP assignment updates sent to the external DHCP database agent.                                                                                                                                                                                                                                                                                                                     |
| Add button                | Opens the <a href="#">DHCP Database Dialog Box, page 60-94</a> . From here you can define a DHCP database agent.                                                                                                                                                                                                                                                                                                        |
| Edit button               | Opens the <a href="#">DHCP Database Dialog Box, page 60-94</a> . From here you can edit the selected DHCP database agent.                                                                                                                                                                                                                                                                                               |
| Delete button             | Deletes the selected DHCP database agents.                                                                                                                                                                                                                                                                                                                                                                              |
| Excluded IPs              |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Excluded IPs or IP Ranges | The IP addresses or address ranges to exclude from DHCP. These addresses are not assigned by the DHCP server to DHCP clients requesting addresses.<br><br>Enter one or more network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new object.<br><br>For more information, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a> . |
| IP Pools Table            |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Name                      | The name of the IP pool.                                                                                                                                                                                                                                                                                                                                                                                                |
| Network                   | The IP address and subnet mask of the IP pool.                                                                                                                                                                                                                                                                                                                                                                          |

**Table 60-38 DHCP Policy Page (Continued)**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Router        | The IP addresses of the default routers used by DHCP clients.                                                                                                                                                                                                                                                                                                                                                                                              |
| DNS Server            | The IP addresses of the DNS servers used by DHCP clients.                                                                                                                                                                                                                                                                                                                                                                                                  |
| NetBIOS (WINS) Server | The IP addresses of the Windows Internet Naming Service (WINS) servers used by Microsoft DHCP clients.                                                                                                                                                                                                                                                                                                                                                     |
| Domain Name           | The domain name for DHCP clients.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Import All            | Indicates whether the remote DHCP server imports certain DHCP options from a centralized DHCP server.                                                                                                                                                                                                                                                                                                                                                      |
| Secured ARP           | Indicates whether secured ARP is enabled on this IP pool to help prevent IP spoofing by unauthorized users.                                                                                                                                                                                                                                                                                                                                                |
| Lease                 | The duration of the lease for each IP address assigned by the DHCP server from this IP pool.                                                                                                                                                                                                                                                                                                                                                               |
| Option 150            | The IP address of the TFTP server required by IP phones for configuration, as defined using DHCP option 150.                                                                                                                                                                                                                                                                                                                                               |
| Option 66             | The IP address of the TFTP server required by IP phones for configuration, as defined using DHCP option 66.                                                                                                                                                                                                                                                                                                                                                |
| Add button            | Opens the <a href="#">IP Pool Dialog Box, page 60-94</a> . From here you can define a DHCP IP address pool.                                                                                                                                                                                                                                                                                                                                                |
| Edit button           | Opens the <a href="#">IP Pool Dialog Box, page 60-94</a> . From here you can edit the selected IP pool.                                                                                                                                                                                                                                                                                                                                                    |
| Delete button         | Deletes the selected IP pools.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Relay parameters      |                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Policy                | The policy that DHCP relay agents implement when they receive messages already containing relay information: <ul style="list-style-type: none"> <li>• Drop—The relay agent discards messages with existing relay information if option-82 information is also present.</li> <li>• Keep—The relay agent retains existing relay information.</li> <li>• Replace—The relay agent overwrites existing information with its own relay information.</li> </ul>   |
| Option                | When selected, enables DHCP Option 82 data insertion in message requests forwarded from the DHCP client to the server. DHCP Option 82 provides the DHCP server with both the switch and port ID of the requesting client. This option makes it possible to locate where a user is physically connected to the network and prevent spoofing. See <a href="#">Understanding DHCP Option 82, page 60-89</a> .<br>When deselected, DHCP Option 82 is disabled. |
| Check                 | When selected, DHCP Option 82 reply packets received from the DHCP server are validated. Invalid messages are dropped; valid messages are stripped of the option-82 field before being forwarded to the DHCP client.<br>When deselected, the option-82 field is removed from the packet without being checked first for validity.                                                                                                                          |

## DHCP Database Dialog Box

Use the DHCP Database dialog box to define external DHCP database agents that contain the automatic bindings. Each database URL that you define must be unique.

For more information, see [Understanding DHCP Database Agents, page 60-88](#).

### Navigation Path

Go to the [DHCP Policy Page, page 60-92](#), then click the **Add** or **Edit** button beneath the Databases table.

### Field Reference

**Table 60-39** *DHCP Database Dialog Box*

| Element      | Description                                                                                                                                                                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Database URL | The URL of the external DHCP database agent containing the automatic bindings. The URL can be in HTTP, FTP, TFTP, or RCP format.<br><b>Note</b> If you define a URL, it is not necessary to define an IP address pool. However, you may do so.  |
| Timeout      | The amount of time (in seconds) the DHCP server should wait for a response from the external DHCP database agent before aborting a database transfer. The default is 300 seconds (5 minutes).<br><b>Note</b> A value of 0 disables the timeout. |
| Write Delay  | The interval (in seconds) between updates sent from the DHCP server to the external DHCP database agent. The minimum delay is 60 seconds. The default is 300 seconds (5 minutes).                                                               |

## IP Pool Dialog Box

Use the IP Pool dialog box to define one or more address pools, which the DHCP server uses to assign dynamic addresses to DHCP clients. You must define at least one address pool, unless you have defined an external DHCP database agent.

### Navigation Path

Go to the [DHCP Policy Page, page 60-92](#), then click the **Add** or **Edit** button beneath the IP Pools table.

Table 60-40 IP Pool Dialog Box

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool Name                       | The name of the IP pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Network                         | <p>The IP address and subnet mask of the IP pool. This subnet contains the range of available IP addresses that the DHCP server may assign to clients.</p> <p>Enter an address and mask or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new one.</p> <p><b>Tip</b> You can exclude specific addresses within the range by defining them in the Excluded IPs field. See <a href="#">DHCP Policy Page, page 60-92</a>.</p> |
| Default Router Addresses        | <p>The IP addresses of the default routers for DHCP clients using this IP pool. After a DHCP client is booted, it begins sending packets to this router, which should be located on the same subnet as the client.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p>                                                                                                        |
| DNS Server Addresses            | <p>The IP addresses of the DNS servers that DHCP clients using this IP pool should query when they need to correlate hostnames to IP addresses.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p>                                                                                                                                                                           |
| NetBIOS (WINS) Server Addresses | <p>The IP addresses of the Windows Internet Naming Service (WINS) servers used by Microsoft DHCP clients to correlate hostnames to IP addresses within a general grouping of networks.</p> <p>Enter up to eight (8) network addresses or network/host objects, or click <b>Select</b> to select an object from a list or to create a new one.</p>                                                                                                                                    |
| Domain Name                     | The domain name for DHCP clients using this IP pool. This name places these clients in the general grouping of networks that make up the domain.                                                                                                                                                                                                                                                                                                                                     |
| Import All                      | <p>When selected, enables remote DHCP servers to import specific DHCP options (such as the DNS server) from a centralized server. Use this option to enable configuration information to be updated automatically.</p> <p>When deselected, all DHCP options are local to this specific server.</p>                                                                                                                                                                                   |
| Secured ARP                     | <p>When selected, enables the DHCP Authorized ARP feature, which limits the leasing of IP addresses to authorized mobile users. This feature helps prevent IP spoofing by unauthorized users. See <a href="#">Understanding Secured ARP, page 60-89</a>.</p> <p>When deselected, the DHCP Authorized ARP feature is disabled.</p> <p><b>Note</b> This feature also disables dynamic ARP learning on an interface.</p>                                                                |

**Table 60-40** IP Pool Dialog Box (Continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
